FOREWORD

The Finnish Rail Administration (RHK) is publishing this Network Statement, which is the fourth Network Statement prepared in Finland, in accordance with the Finnish Railway Act. The Network Statement describes the access conditions, the state-owned rail network, the capacity allocation process, the services supplied to railway undertakings, and the principles of determining the infrastructure charge. The Network Statement is published for applicants for capacity for each timetable period separately. The present Network Statement is intended for the timetable period 10.12.2006–8.12.2007.

The Network Statement 2007 has been prepared on the basis of the previous Network Statement by taking into account the feedback received from users, and the results of a seminar organised for the purpose of developing the Network Statement. RHK has in addition conducted a Network Statement development survey in which several Network Statement users were interviewed and Network Statements of other European Infrastructure Managers were examined.

The structure of this Network Statement follows the common European structure. It consists of the following chapters:

1. General Information
2. Access Conditions
3. Infrastructure
4. Capacity Allocation
5. Services
6. Charges

Within the Finnish Rail Administration, the Network Statement is the responsibility of the Traffic System Department. All RHK's departments and several outside specialists have been involved in the preparation of the Network Statement.

Helsinki, 8th December 2005

Finnish Rail Administration
Traffic System Department

TABLE OF CONTENTS

1 GENERAL INFORMATION

1.1 Introduction

The Network Statement is published in accordance with the Railway Act (198/2003) and Directive 2001/14/EC of the European Parliament and of the Council on the allocation of railway infrastructure capacity and the levying of charges for the use of railway infrastructure and safety certification (hereinafter referred to as the "Capacity and Infrastructure Charge Directive"). The Network Statement for the timetable period 2007 is the fourth Network Statement published in Finland.

1.2 Objective

The Network Statement describes the access conditions, the state-owned rail network, the capacity allocation process, the services supplied to railway undertakings and the basis on which the infrastructure charge is determined. The Network Statement specifies in detail the general rules, deadlines, procedures and grounds applicable to capacity allocation and the charging systems.

The Network Statement is published for the use of applicants for capacity for each timetable period separately. Railway undertakings can request capacity for international traffic within the European Economic Area as well as for domestic freight traffic. Domestic passenger traffic may be operated only by VR Ltd[1].

1.3 Legal Framework

Current legislation

In accordance with § 4 of the Railway Act, RHK publishes information on the provisions of the Railway Act, the Act on the Interoperability of the Trans-European Rail System (561/2002) and the Railway Infrastructure Tax Act as well as on the provisions issued under these Acts and other provisions, concerning

1) the right of access to the rail network;
2) the principles of determining the infrastructure charges;
3) applying for infrastructure capacity and the related deadlines;
4) the requirements for and approval of railway rolling stock; as well as
5) other conditions concerning operating and starting the operation of rail traffic.

RHK publishes information on the nature and extent of the rail network in the Network Statement for each timetable period. This information is contained in Chapter 3 of this Network Statement. The provisions issued by RHK on:

1) specialised infrastructure under § 18(1) of the Railway Act (point 3.4.2);
2) the priority order to be applied to congested infrastructure under § 18(2) of the Railway Act (point 4.4.3);

[1] Until 31.12.2006 domestic freight traffic may only be operated by VR Ltd

3) the threshold quota for the minimum use of railway infrastructure on each train path under § 23(2) of the Railway Act (point 4.6) are also published in the Network Statement.

Future Legislation

During the drafting of the Network Statement a new Railway Act has been prepared. The new Act harmonizes the current Railway Act with the Act on the Interoperability of the Trans-European Rail System. The new Act incorporates the second railway package of the European Union into Finnish national legislation.

1.4 Legal Status

1.4.1 General Remarks

The Network Statement is published for applicants of rail capacity. The Network Statement is not a regulation issued by RHK but a document providing information.

1.4.2 Liability

Information published in the Network Statement do not affect regulations issued by RHK.

1.4.3 Appeals Procedure

A decision taken by RHK may be appealed against under the Railway Act by filing a claim for rectification with the Regulatory Body, which in Finland is the Ministry of Transport and Communications. A claim for rectification may be filed if the decision taken by RHK concerns:

1) priority order for allocating capacity in individual cases;
2) levying of the infrastructure charge;
3) capacity allocation;
4) allocation of urgently needed capacity;
5) issuance of a safety certificate; or
6) the access contract.

The claim for rectification shall be filed with the Ministry of Transport and Communications within 30 days of the date of receipt of notice of the decision. The Ministry shall decide on the claim for rectification within two months of the date on which all relevant information for taking a decision has been delivered to it. The decision shall, however, be taken within ten days of the date on which all relevant information has been delivered if the claim concerns the priority order in individual cases, capacity allocation or a request for urgently needed capacity.

1.5 Structure of the Network Statement

This Network Statement follows the common structure set for network statments by RailNetEurope.

1.6 Validity and Updating Process

1.6.1 Validity Period

The Network Statement is valid for one timetable period. It is published four months ahead of the expiry of the deadline for submission of capacity requests, i.e. 12 months ahead of the timetable period. The Network Statement 2007 is intended for the timetable period 2007, i.e. for the period 10.12.2006–08.12.2007. The Network Statement for the timetable period 2008 will be published by 08.12.2006 at the latest.

1.6.2 Updating Process

If information contained in item 1.3 changes RHK will publish the changes in it's publications.

Track work which will probably be carried out during the timetable period 2007 and might affect traffic is specified in Appendix 11 of this Network Statement. RHK will inform rail capacity applicants of any changes.

1.7 Publishing

The Network Statement is published in three languages: Finnish, Swedish and English. If any discrepancies are found between the different language versions the Finnish language version will prevail. The Network Statement is available in printed form from RHK and in pdf form on RHK's Internet pages at www.rhk.fi/english.

Development plans for the rail network for 2007-2010 are presented in RHK`s action plan[2] (TTS) of RHK. Statistics concerning the rail network and railway traffic are presented in the annually published Finnish Railway Statistics.

Ministry of Transport and Communications
P.O. Box 31 (Eteläesplanadi 16-18)
FI-00023 Valtioneuvosto (Helsinki)

Phone: +358 9 160 02
Fax: +358 9 160 28596
E-mail: kirjaamo@mintc.fi
Internet: http://www.mintc.fi

[2] TTS can be ordered from RHK. It is also available on RHK`s Internet pages (http://www.rhk.fi).

Regulatory Body

Ministry of Transport and Communications (Until 31.8.2006)
Railway Safety Authority (From 1.9.2006)

Railway Safety Authority

The co-called Safety Directive of the Second Railway Package calls for the establishment of an authority responsible for national rail safety. The Safety Authority will be established in Finland on 1 September 2006. The authority's tasks include, in addition to those required by the Directive, acting as a regulatory body.

Finnish Rail Administration (RHK)

The Finnish Rail Administration (RHK) is a civil service department subordinated to the Ministry of Transport and Communications. RHK is in charge of maintaining and developing the network as well as ensuring the safety of rail transport and performing other official duties associated with rail infrastructure management.

1.9 Cooperation between Infrastructure Managers

European Infrastructure Managers have signed an agreement on a common sales and marketing organisation for international infrastructure capacity called RailNetEurope (RNE). These infrastructure managers have set up a One Stop Shop (OSS) network which offers customers a single service point. For international train path applications a railway undertaking should contact a OSS contact person who sets up the required international train path.

One Stop Shop

- Offers customer attention and information on the full product and service range of the Infrastructure Managers;
- Supplies all the information required to gain access to and use the infrastructure of any Infrastructure Manager participating in RNE-RailNetEurope;
- handles requests for any international train path within RNE-RailNetEurope;
- makes sure that requests for the next timetable period are duly taken into account in the yearly Forum Train Europe timetabling process;
- provides train path offers for the whole international journey

Each One Stop Shops contact person is part of an international network the aim of which is to facilitate the customer's access to the rail network. OSS also offers customers information on infrastructure payments and circulation. OSS provides through a single customer contact point proficient services internationally, one-on-one, confidentially, impartially and without discrimination. Contact information of OSS contact persons are available on RailNetEurope's web page[7].

The members of RailNetEurope are

- Banedanmark (Denmark),
- Banverket (Sweden),
- BLS Lötschbergbahn AG (Switzerland),
- Ceske Drahy (CD) / SZCD (Czech Republic)
- CFR (Romania)
- Chemins de fer Helléniques / Hellenic Railways (Greece),
- DB Netz AG (Germany),
- Eurotunnel (France / UK),
- Győr-Sopron-Ebenfurti Vasút Rt. / Raab-Oedenburg-Ebenfurter Eisenbahn AG (Austria/Hungary),
- Jernbaneverket (Norway),
- Network Rail (former Railtrack PLC) (UK),
- Österreichische Bundesbahnen (Austria),

- Société Nationale des Chemins de Fer Luxembourgeois (Luxembourg),
- Železnice Slovenskej republiky (Slovakia)
- Vasúti Pályakapacitás-elosztó Kft. (Hungary).

Network Statements of other countries

Internet addresses and names of Network Statements published by other rail network administrators are listed in appendix 13.

1.10 Glossary

Automatic train protection (ATP) ATP is a system which monitors train movement.

Congested infrastructure An element of infrastructure for which the demand cannot be fully satisfied even after co-ordination of the different requests for capacity.

Coordination A procedure by which RHK and the applicants attempt to solve situations where there are competing requests for infrastructure capacity.

Infrastructure capacity The capacity of a train path to carry train traffic over a particular period of time and depending on the characteristics of the rail network.

Infrastructure maintenance Construction, maintenance and development of tracks, of structures, equipment and systems connected with them as well as of real property needed for infrastructure maintenance.

Loading gauge The space inside which the load on an open wagon shall remain when the wagon is in the centre position on a straight, even track.

Main lines are the trunk lines of Finland's railway network. A main line is a track on which mainly scheduled trains run services. A list of main lines is presented in the publication "Technical rules and guidelines connected with the Train Safety Regulations".

Museum train traffic Traffic operated on a small scale on the rail network by a non-profit association with museum trains or comparable rolling stock.

Private siding A track, connected to the state-owned rail network, which is not managed by RHK, except international connecting tracks at border stations.

Rail network The state-owned rail network managed by RHK.

Railway undertaking A company or other association under private law whose main activity is to operate rail traffic on the basis of an appropriate operating licence issued in the European Economic Area and which has in its possession rolling stock needed for operating traffic. Undertakings providing only traction services are also regarded as railway undertakings.

Traffic with rail vehicles on the rail network, operated by a railway operator or connected with infrastructure maintenance or related activities, as well as other traffic crossing the track area of the rail network, except road traffic at level-crossings under the Road Traffic Act (267/1981).

Traffic control is the management of traffic on individual train paths. In addition traffic control duties include issuing train safety notices and permits required for train traffic. Traffic control personnel also receive information and issue permits for work done on or near the tracks and receive information on the termination of such work. A remote controller or train dispatcher is responsible for traffic control. If so required due to the volume of traffic and safety apparatus a signals or turnout worker, shunting foreman, engine driver or a worker responsible for the safety of work done near the tracks or other person appointed in due order for the task may participate in traffic control to the extent required by their task.

2 ACCESS CONDITIONS

2.1 Introduction

In this chapter are listed access requirements to the rail network. Prerequisites for operating railway traffic are an operating licence, safety certificate, allocated capacity and an access contract. In addition e.g. the rolling stock acceptance process and traffic safety staff qualifications are described in this chapter.

2.2 General Access Requirements

The legal framework of access to infrastructure is described in the Railway Act (198/2003) and in the Act on the Interoperability of the Trans-European Rail System (561/2002, as amended by Act 200/2003).

Pursuant to the Act on the Interoperability of the Trans-European Rail System, the Government Decree on the Interoperability of the Trans-European Rail System (765/2002) has been issued. This Decree lays down e.g. the essential requirements for the rail system. RHK issues supplementary provisions to the essential requirements under the said Act.

The provisions issued by RHK shall be observed on the state-owned rail network. These provisions are either provisions implementing the Community provisions on interoperability or RHK's national provisions. Information on the provisions issued by RHK currently in force is available from the Finlex Data Bank[8].

2.2.1 General Requirements for operating railway traffic

Operation of rail traffic on the state-owned rail network requires that the railway undertaking meet the following conditions:
1) The railway undertaking or international grouping of railway yndertakings shall have an operating licence in accordance with the Railway Act or a corresponding operating licence issued in the European Economic Area, unless the question is of museum train traffic referred to in the Railway Act.

2) The licence holder shall have a safety certificate in accordance with the Railway Act, issued or approved by RHK, which covers all the train paths on which traffic will be operated. The Railway Safety Authority will issue and approve the safety certificate from 1.9.2006.

3) The licence holder shall make an access contract with RHK on necessary practical arrangements concerning the operating of railway traffic.

4) Capacity in accordance with the Railway Act has been allocated to the railway undertaking for its traffic.

[8] http//www.finlex.fi/

5) Other conditions for operating rail traffic, laid down in or under the Railway Act and the Act on the Interoperability of the Trans-European Rail System, are in all respects fulfilled.

Access conditions and phases for entering the market are presented in figure 2.

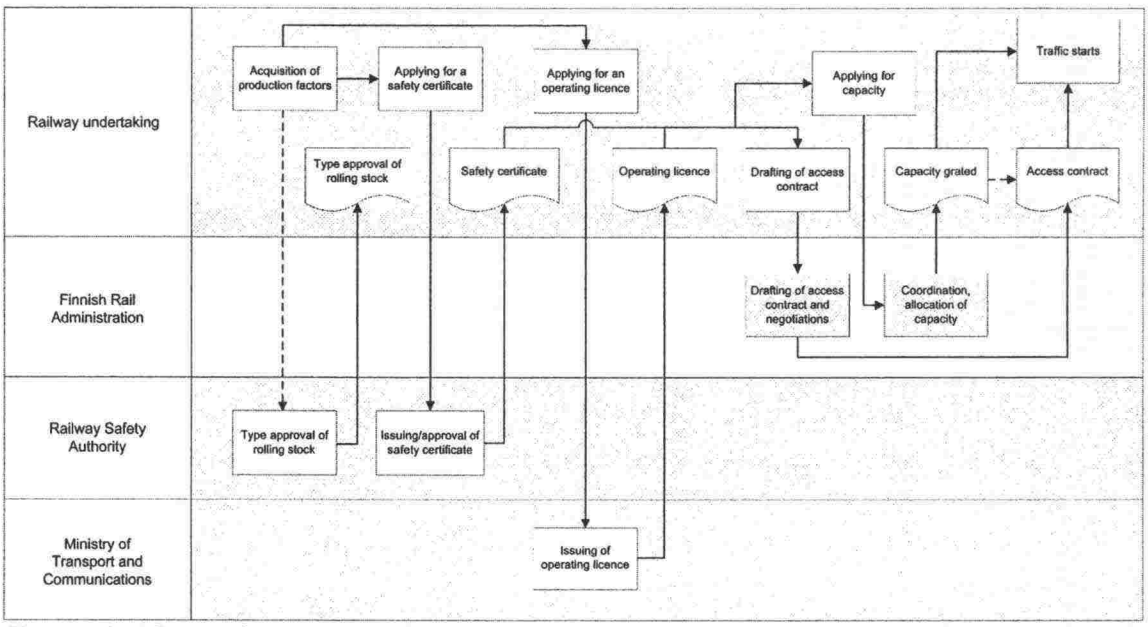

Figure 2. Phases for entering the market

Museum Traffic

The same requirements described in this Network Statement are applied to museum train traffic as to other rail traffic, except as concerns the operating licence. Capacity may be requested only as urgently needed capacity. RHK has drawn up instructions for museum train traffic operators for attending to certain matters regarding access to the network. The instructions can be obtained from the Traffic System Department of RHK.

2.2.2 General requirements for access to the rail network

The following railway undertakings or international groupings of railway undertakings may access the state rail network to operate train traffic.

1) the railway undertakings and international groupings of railway undertakings referred to in the Railway Act providing domestic freight services[9] or passenger services in international rail traffic between states belonging to the European Economic Area;

2) the rail transport operating subsidiary of the limited company referred to in the Act on the Incorporation of the Finnish State Railways (20/1995) for providing services in domestic passenger traffic, as well as in traffic between Finland and Russia.

These railway undertakings and international groupings of railway undertakings (*infra* railway undertaking) may use the rail network in accordance with the Railway Act and the traffic operating points on the state-owned rail network for their traffic operating on separately agreed conditions (access contract). Other undertakings or associations may also use individual traffic operating points on the rail network for their rail services, provided that this traffic serves a private siding connected to a traffic operating point and that an agreement on traffic operating has been made with RHK.

2.2.3 Operating licence

The Ministry of Transport and Communications issues an operating licence for the operation of rail traffic to applicants established in Finland. The Ministry reviews the operating licence and its conditions every five years. An operating licence issued in one state belonging to the European Economic Area is valid throughout the territory of the European Economic Area.

2.2.4 Safety Certificate

The safety certificate is issued by the national safety authority. In Finland, it is issued by RHK (from 1.9.2006 the Railway Safety Authority). RHK has drawn up instructions how to apply for a safety certificate. The instructions can be obtained from the Safety and Environment Department of RHK.

The purpose of the safety certificate is to ensure that the applicant fulfills the safety requirements for its operations and that the undertaking has the necessary qualifications to operate safely on the rail network. These requirements are presented in the Railway Act. It is also possible to include other requirements in the safety certificate regarding railway safety. The purpose of these requirements is ensure railway safety while taking into consideration the nature and scope of the railway traffic of the applicant. The aforementioned requirements are presented in more detail and explained in the instructions on how to apply for a safety certificate drawn up by RHK.

[9] Until 31.12.2006 domestic freight traffic may only be operated by VR Ltd.

RHK requires information on:

- Applicant's safety management system and other arrangements by the undertaking and its management ensuring that regulations concerning rail traffic safety are observed;
- Safety organisation and information on how responsibility is divided in rail safety issues
- Safety instructions and guidelines followed by the undertaking
- Safety training, qualifications and supervision of personnel
- Certain matters regarding rolling stock
- Accident investigation and preparedness for accidents
- Risk mapping and assessment
- Subcontracts.

The written application shall be submitted to RHK. The Safety Department shall consider the application and if necessary request further information. RHK shall take a decision on the issuance or approval of the operating licence within four months after the request has been filed with it. RHK may grant a safety certificate for the entire state rail network or individual train paths. If the nature or the scope of the undertaking or international grouping of railway undertakings changes fundamentally, it shall apply for a new safety certificate or request that RHK reapproves the safety certificate.

2.2.5 Insurance

A rail transport operator shall have a sufficient liability insurance or other corresponding arrangement in case of such damage incurred by a party due to rail transport operations for which the operator is by law or contract responsible for. The insurance or other corresponding arrangement shall be in force for the duration of the entire period during which rail transport is operated.

2.3 How to apply for a Train Path

A railway undertaking has to fulfil the following criteria to apply for rail capacity:

- The undertaking shall have an operating licence in conformity with the Railway Act or a corresponding licence issued in the European Economic Area unless it is a question of museum traffic referred to in the Railway Act.
- The undertaking shall, in compliance with the railway Act, have a safety certificate for all the train paths on which the undertaking is planning to operate.

Applying for rail capacity and capacity allocation are described in chapter 4 of the Network Statement.

2.4 General Business Conditions

2.4.1 Framework Agreement

RHK may make a framework agreement on the use of capacity with applicants for capacity. The purpose of such an agreement is to specify the characteristics of the capacity requested by the applicant. The framework agreement does not, however, entitle the applicant to obtain such capacity as is specified in the agreement.

Railway undertakings shall request the capacity specified in the framework agreement for each timetable period separately. If requested, RHK allocates the capacity specified in the framework agreement following the procedure laid down in the Railway Act. Correspondingly, the access contract shall be concluded for each timetable period separately regardless of the framework agreement. The framework agreement does not, however, impede the application of the provisions of the Railway Act to other applicants for capacity.

The framework agreement is made for a maximum period of ten years. For special reasons, RHK may, however, conclude framework agreements for a longer period as well. Conclusion of an agreement for a period over ten years can, however, be justified only by contracts, special investments or special business risks connected with the transport business of the party with which the agreement is concluded, as well as by the large-scale and long-term investments of the party with which the agreement is concluded or the contractual obligations connected with such activities.

2.4.2 Access Contracts

Railway operators shall make an access contract with RHK on the use of necessary services with regard to the state rail network and operating railway traffic. These services include e.g. the use of marshalling yards, storage sidings and other tracks, as well as use of traffic control services. It is also possible to agree on other practical arrangements concerning railway traffic operations.

The railway traffic operator shall contact RHK to prepare the access contract and contractual negotiations as early as possible, preferable before applying for capacity. RHK makes this contract with each licence holder while taking into account the nature and scale of capacity allocated. The access contract is made for each timetable period and can be changed if decisions made during the timetable period concerning the allocation of capacity or other facts, e.g. concerning the condition of the rail network so require. The access contract can only be concluded after the all the preconditions for making the is that the licence holder meets the other conditions stipulated in the Railway Act for operating railway traffic have been fulfilled. After the contract has been concluded, traffic may be started.

2.5 Operational Rules

Operational rules drafted by RHK can be viewed on the RHK web site and legislative information on the Finlex web site[10].

2.6 Exceptional Transports

Traffic restrictions are dealt with in item 3.4. RHK regulations concerning railway traffic and rolling stock can be viewed on the web site Finlex and other instructions on the RHK web site.

2.7 Dangerous Goods

Transport of dangerous goods is dealt with in item 3.4.3. RHK regulations concerning railway traffic and rolling stock can be viewed on the web site Finlex and other instructions on the RHK web site.

2.8 Rolling Stock Acceptance Process Guidelines

An authorisation issued by RHK is required for placing rolling stock in service. This authorisation can be issued for rolling stock that meets the requirements valid in Finland, which are laid down in legislation.

The requirements are based on the interoperability requirements for the rail system in accordance with Community law and RHK has issued complementary and more detailed instructions. Conformity can be proved by the EC Declaration of Conformity or a corresponding declaration issued within the European Economic Area. In other cases, RHK is responsible for technical approval for the authorisation to place rolling stock in service. From 1.9.2006 the Railway Safety Authority is responsible for rolling stock acceptance.

2.9 Safety Acceptance Process

In accordance with the Railway Act, traffic safety staff shall meet the health, training and other qualification requirements laid down in Finnish legislation. Specific provisions on qualifications are laid down in the Traffic Safety Tasks Act which came into force on 1.1.2005. The Act lays down qualification requirements for personnel working with traffic safety tasks which have a direct impact on rail traffic safety. Those working in these tasks shall also meet the RHK requirements concerning health, training and other qualifications. The qualification requirements vary depending on the job.

Before RHK issues or approves a safety certificate, the railway operator shall provide it with information on the qualifications of its traffic safety staff. The agency issuing the safety certificate may also in other ways examine in more detail whether a person or a group of persons meets the necessary qualification requirements. Supervision of traffic safety staff will be conducted by the Railway Safety Authority from 1.9.2006.

[10] Http://www.finlex.fi

3 INFRASTRUCTURE

3.1 Introduction

The infrastructure refers to the state-owned rail network managed by RHK. RHK is responsible for infrastructure maintenance, i.e. for the construction and maintenance of tracks, of structures and equipment connected with them, as well as of real property needed for infrastructure maintenance.

3.2 Extent of Network

3.2.1 Limits

The available network is presented graphically in Figure 3 (state-owned rail network) and in Appendix 1 (Infrastructure Register).

The following line sections are closed for traffic:
- Kankaanpää–Niinisalo
- Kihniö–Aitoneva
- Raudanlahti–Säynätsalo
- Pesiökylä–Taivalkoski
- Kolari–Äkäsjoki
- Niesa–Rautuvaara.

The following line sections are open for traffic in summer only (no snow ploughing, no maintenance of switches, no snow and ice clearance at level-crossings):
- Kiukainen–Säkylä.

The closure of the following line sections is planned but a decision on the date has not been made.

- Parkano-Niinisalo
- Parkano-Kihniö
- Kiukainen-Säkylä.

3.2.2 Connected Railway Networks

There is a rail connection from Finland to Sweden via Tornio. The main outlines of traffic operating on the Tornio–Haparanda line section are presented in Appendix 3. The Swedish infrastructure manager is Banverket[11].

From Finland to Russia a rail connection exists via Vainikkala, Imatrankoski, Niirala and Vartius. Rail traffic between Finland and Russia is based on the Rail Traffic Agreement between Finland and Russia. Traffic between Finland and Russia is not internal international traffic within the European Economic Area. Only VR Limited has access to the Finnish rail network in traffic between Finland and Russia.

[11] http://www.banverket.se

3.3 Network Description

3.3.1 Geographic Identification

3.3.1.1 Track Typologies

The network is presented in figure 3 and in the infrastructure register (appendix 1).

3.3.1.2 Track Gauges

The nominal track gauge on the rail network 1,524 mm. The tolerance range is -6...+20 mm. The speed-dependent limit values for the track gauge are indicated in the RAMO publication, part 13 "Radan tarkastus" (Track inspection).

3.3.1.3 Stations and Nodes

The available traffic operating points (stations) are presented in Figure 4 and in Appendix 2 (Traffic Operating Point Register).

The following traffic operating points are open for traffic in summer only (no snow ploughing, no maintenance of switches, no snow and ice clearance at level-crossings):

- Kauttua
- Säkylä.

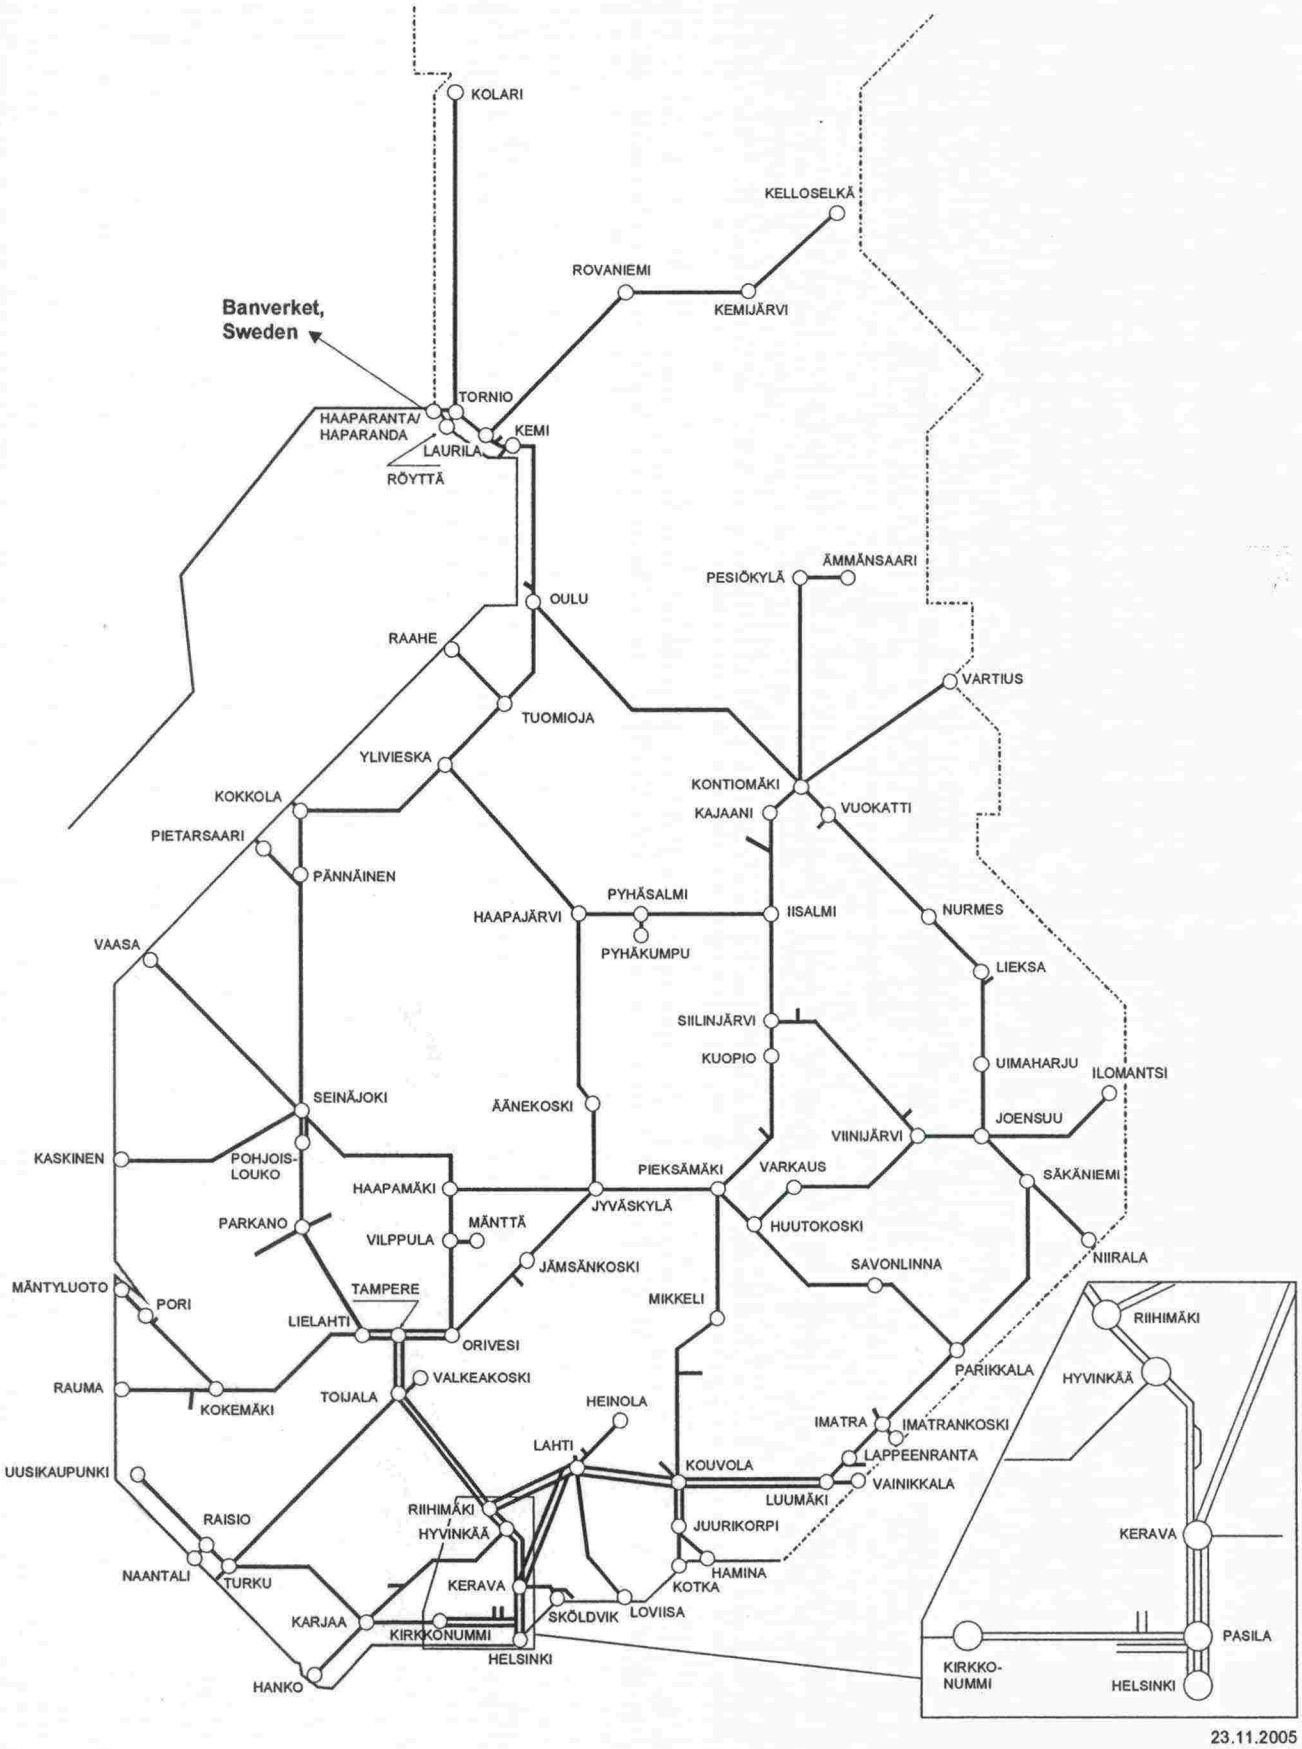

Figure 3. State-owned rail network at the beginning of timetable period 2007.

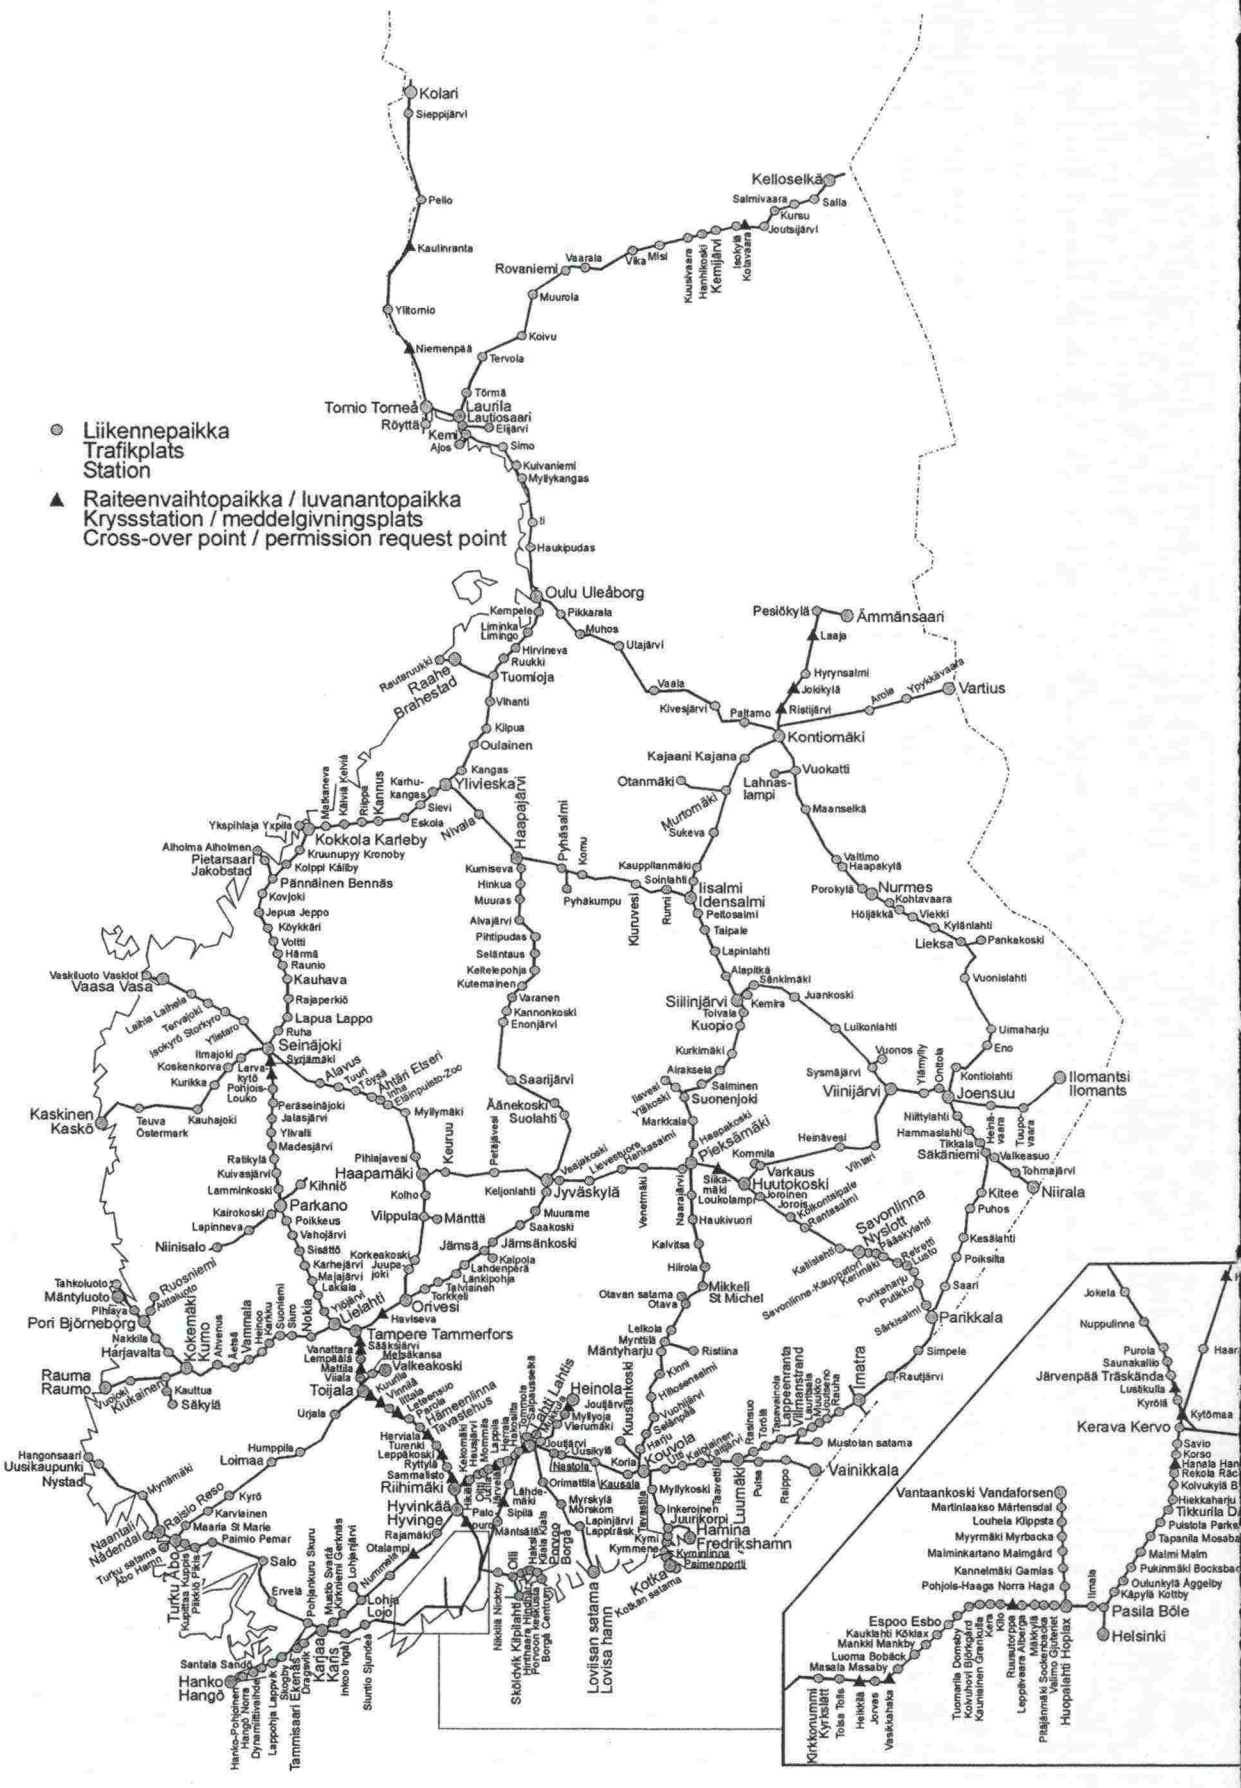

Figure 4. Traffic operating points on the state-owned rail network at the beginning of timetable period 2007.

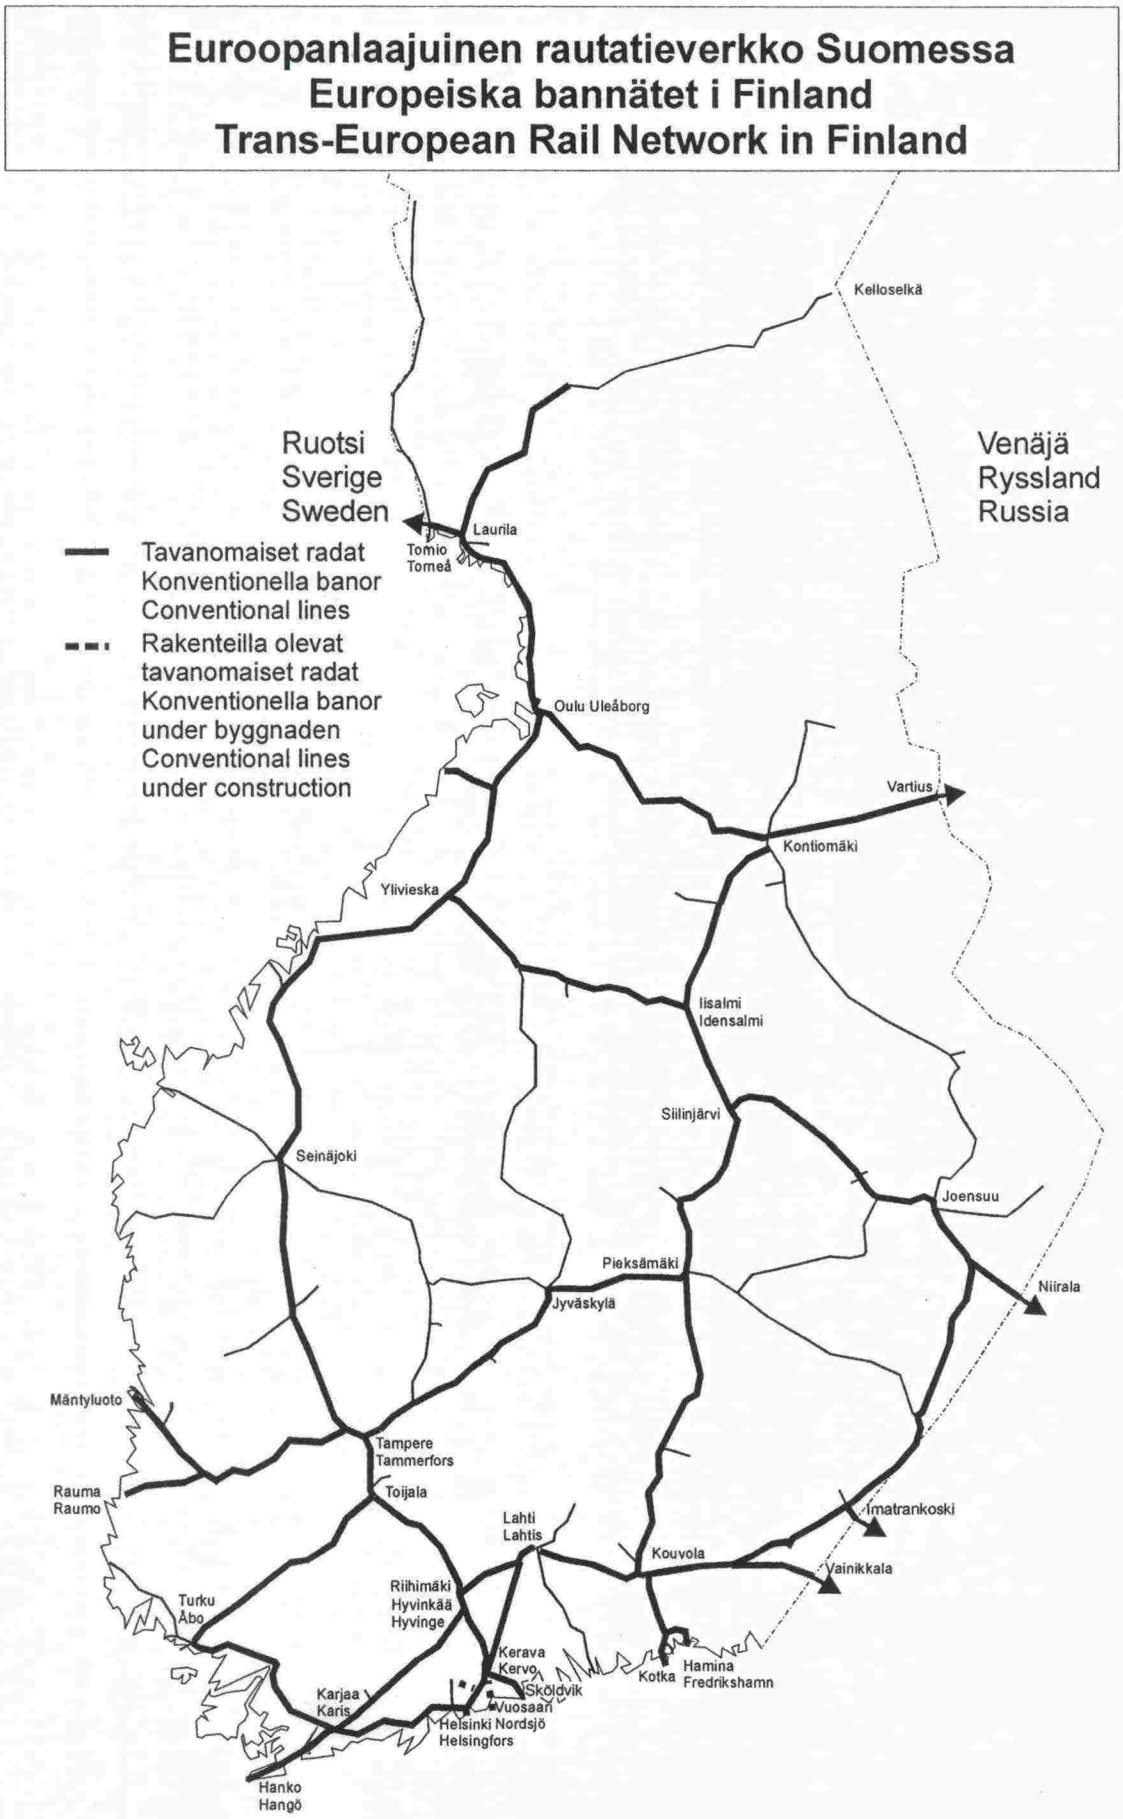

Figure 5. The Finnish TEN network.

3.3.2 Capabilities

3.3.2.1 Loading Gauge

The loading gauge (KU), Appendix 4, and the structure gauge (ATU) FIN1, Appendix 5, are used on the whole state-owned rail network. On private industrial sidings, there may be both loading and structure gauge limitations, which railway undertakings shall clarify separately for carrying out transportation.

The vehicle gauge (LKU) is specified in the LIMO publication, point 1 "Yleiset määräykset" (General rules).

3.3.2.2 Weight Limits

Axle loads

22.5 ton axle loads are permitted on the most part of the rail network. The maximum permitted axle loads per line section are indicated in Appendix 6 (Speeds and axle loads).

Meter Loads

On the whole state-owned rail network, the permitted meter load of rolling stock is 8.0 tons/m.

3.3.2.3 Line Gradients

The maximum gradient is 12.5 mm/m on the main lines and 22.5 mm on the secondary lines. The characteristic gradients of the line sections are indicated in Appendix 1 (Infrastructure Register).

3.3.2.4 Line Speeds

The maximum speed is 220 km/h for passenger trains and 120 km/h for freight trains. The speeds permitted for passenger and freight trains on the rail network are indicated in Appendix 6 (Speeds and axle loads).

3.3.2.5 Maximum Permitted Train Lengths

The maximum train length permitted on a line section shall be such that trains can also use secondary tracks at the traffic operating points. Trains need not, however, be capable of using all secondary tracks at all traffic operating points. The train lengths used for dimensioning line sections are 550, 625, 725, 825 and 925 meters[12]. The longest secondary tracks at each traffic operating points are indicated in Appendix 2 (Traffic Operating Point Register).

[12] At present, the minimum dimensioning length is 725 m.

3.3.2.6 Power Supply

On all electrified lines, power is taken from the catenary above the track in such a way that one or both of the running rails form a return circuit. Rated voltage is 25 kV/ 50 Hz AC. The electrified line sections are indicated in Appendix 1 (Infrastructure Register).

For fixed installations, electrification is described in part 5 "Sähköistetty rata" (Electrified railway) of the RAMO publication, and for the electric equipment of rolling stock in the LISO publication.

3.3.3 Traffic Control and Communications Systems

3.3.3.1 Signalling Systems

A line with section block is a line which is divided into block sections. The minimum distance between block sections is the breaking distance of a train. Only one train may be in a block section at a time.

The signalling systems in use are indicated in Appendix 1 (Infrastructure Register) and graphically in Appendix 7 (Signalling Systems).

Hot box detectors have been placed on the rail network at 50 km intervals on line sections on which the greatest speed is or can be over 160 km/h. In addition hot box detectors have been placed in the vicinity of busiest junction stations. A map of the location of the hot box detectors is presented in Appendix 7.

3.3.3.2 Traffic Control Systems

The line sections equipped with an automated traffic control system are indicated in Appendix 1 (Infrastructure Register) and in Appendix 7 (Signalling Systems). The following automated traffic control systems are used: centralised traffic control; train detection and train integrity monitoring; and radio control. On the CTC- and radio-controlled lines, all routes are equipped with the remote control of points and routes. On the secondary, loading and storage sidings of these line sections, however, local route setting may also be necessary. On radio-controlled lines, routes shall be set locally if it is necessary to operate on secondary, loading or storage sidings. Availability of the traffic control services on specific line sections shall be agreed upon with RHK in the access contract.

3.3.3.3 Communications Systems

The Train Safety Regulations prescribe that, before the departure of the train, the driver must have at his disposal the timetable; the line section description; an advance notice of exceptional circumstances affecting traffic safety or corresponding information; a list of braked weights, including a vehicle list; and he must have received the information that the train is in running order and the brakes have been checked and tested. The contents of these documents are described in more detail in the Train Safety Regulations.

Information on exceptional situations is transmitted through the Advance Notification System (ETJ), maintained by RHK. The railway undertakings shall join this system, which transmits information both on circumstances affecting traffic operating temporarily and on permanent changes on the selected route practically in real time.

Communication between traffic controllers and drivers takes place in the Finnish language orally, by phone, through signals or by radio. A line radio system with a channel reserved for each line section is used on the rail network. The same radio system can also be used for directing shunting operations, provided that the parties agree on the channels to be used. Speech is heard by all shunting units operating on the same channel within the range of audibility.

Speech transmitted via voice communication devices is recorded. Recordings are used for controlling traffic communication, as well as for investigating accidents and hazardous situations.

3.3.3.4 ATC Systems

Automatic train protection means equipment with which it is ensured that trains keep to the speed limits and obey other signals.

The Train Safety Regulations make it possible to operate without ATP equipment at 80 km/h on a line with ATP. Museum trains and track machinery which do not yet have ATP equipment may operate on the network under current terms until the construction of ATC3 has been completed. It is estimated that it will be completed by the end of 2006. Subsequently equipment shall have to have the required ATP fittings.

3.4 Traffic Restrictions

3.4.1 Specialised Infrastructure

RHK may designate a train path or a part of it as specialised infrastructure, if there are sufficiently alternative routes for other traffic. Specialised infrastructure refers to a train path or a part of it on which priority is given to the type of traffic for which the infrastructure is specialised. So far RHK has not designated any line section in Finland as specialised infrastructure.

Under 4.4 of the Network Statement, RHK gives detailed provisions on the priority order according to which a specific type of traffic may get priority when allocating capacity on congested infrastructure.

3.4.2 Environmental Restrictions

The requirements laid down in RHK's LIMO publication, are applied when registering rolling stock. LIMO sets out general and special requirements for rolling stock concerning noise, vibration, electromagnetic interferences, emissions, environmentally dangerous substances and the use of recycled construction materials.

Vibration-related speed restrictions are imposed on parts of the railway line on twelve line sections throughout Finland. The restrictions mainly apply to over 3,000 ton gross weight heavy trains (Appendix 8).

3.4.3 Dangerous Goods

Finland has signed the intergovernmental OTIF Convention, which regulates international rail traffic. Russia and other CIS countries have not acceded to the OTIF Convention. One of the annexes to COTIF are the Regulations concerning the International Carriage of Dangerous Goods by Rail (RID). The RID Regulations apply as such to the international rail transport of dangerous goods. The domestic rail transport of dangerous goods is regulated by the provisions transposed into Finnish legislation in accordance with the RID framework directive (96/49/EC).

The most important differences compared to the RID regulations are as follows: cold resistance requirement for certain packagings and tanks in domestic traffic is -40°C (RID -18 and -20°C); as well as the regulations concerning protection wagons and the bringing of wagons loaded with explosives to traffic operating points and the temporary storage of explosives. The decree of the Ministry of Transport and Communications also takes into account the requirements of the so-called VOC directive (94/63/EC) concerning the recovery of vapours from petrol in connection with rail transport.

No absolute restrictions have been imposed on the transport of dangerous goods if carried out according to the regulations. It is recommended that wagons loaded with dangerous goods should not be parked in densely populated or groundwater areas. The transport of dangerous goods on tracks with spike fastening or laid with 43 kg rails shall be avoided.

It is prescribed by Government decree that railway undertakings shall carry out a safety analysis for railway yards through which considerable quantities of dangerous goods are carried. The safety analysis shall be submitted to the local rescue and environmental authorities for an opinion. The safety plan is approved by RHK.

3.4.4 Tunnel Restrictions

There are tunnel restrictions on the Helsinki–Turku line section. The restrictions are indicated in Appendix 9.

3.4.5 Bridge Restrictions

Bridge restrictions are described in Appendix 10.

3.5 Availability of the Infrastructure

Other restrictions than those listed in item 3.4 are described in the Train Safety Regulations and in the Advance Notification System. Track work causing traffic restrictions is presented in appendix 11.

3.6 Service Facilities

Train Formation Yards

Train formation yards are railway yards in which the layout and size of the track system make it possible to form trains. The train formation yards are indicated by the marking "Shunting" in Appendix 2 (Traffic Operating Point Register).

Storage Sidings

Storage sidings are yard tracks which are primarily intended for the parking of wagons and coaches waiting for a transport task. Storage sidings can also be used for other purposes required by traffic operating. The local traffic control centre determines which tracks are used as storage sidings.

Maintenance and Service Facilities

The 400 and 1,500 V power supply facilities for rolling stock are indicated in Appendix 2 (Traffic Operating Point Register). For the 400 V power supply, also the maximum current available is indicated in amperes.

Freight Terminals

Loading possibilities are indicated in Appendix 2 (Traffic Operating Point Register). K means "yes" and Y "private".

Private siding connections at traffic operating points are indicated by the marking "Private sidings" in Appendix 2 (Traffic Operating Point Register).

Passenger Stations

The lengths of passenger platforms (shortest/longest) are indicated in Appendix 2 (Traffic Operating Point Register). The platforms not maintained by RHK are indicated in brackets.

3.7 Infrastructure Development

Rail network development plans are presented in RHK's Action Plan for the years 2007–2010. At the end of 2004[13] about 1/5 of the rail network had a superstructure which is more than 30 years old and in need of renovation. The most critical challenge for track maintenance during this planning period is the completion of the renovation, which to date has progressed well, and its extension also to railway yards. At the same time increased costs brought on by the increase in prices of technology and materials have to be kept under control.

During this planning period discussions will be held over the future of the part of the rail network with low traffic volumes. Decisions will have to be made concerning the length of the railway network before the renovation of track sections with low traffic volumes becomes inevitable.

[13] Read the Action Plan in Finnish at http://www.rhk.fi or order from RHK.

The development plans for the years beyond the period covered by Action Plan are presented in the "Rail Network 2025" report.

4 CAPACITY ALLOCATION

4.1 Introduction

The legal framework of capacity allocation is described in the Railway Act (198/2003) and in the Government Decree on the Timetable Period in Rail Traffic and Applying for Infrastructure Capacity (207/2003).

4.2 Description of Process

Capacity for operating regular train services on the state-owned rail network shall be requested from RHK for each timetable period within the period of time defined. Capacity for regular train services can also be requested during the timetable period. The schedule for train path requests and for allocation process is shown in a diagrammatic form in Figure 6. It is also possible to make ad hoc requests for capacity for other than regular traffic.

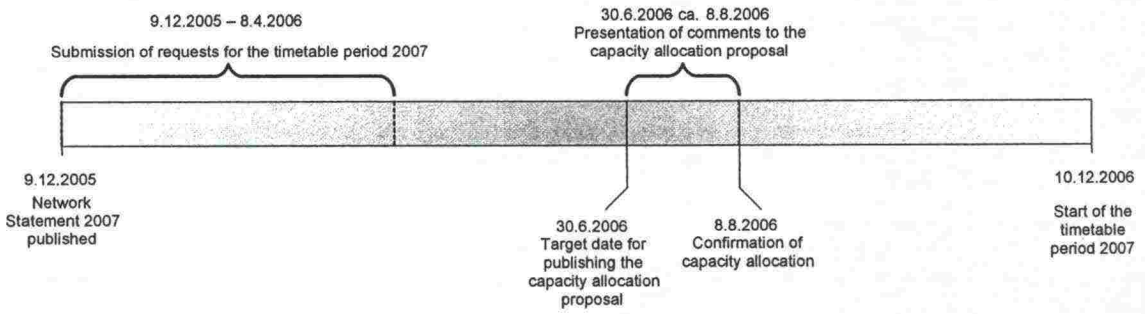

Figure 6. Diagrammatic presentation of the schedule for train path requests and for allocation process.

4.3 Schedule for Train Path Requests and Allocation Process

Capacity requests

RHK has drawn up instructions for capacity requests. The contents of these instructions are described in this chapter. The capacity request instructions can be used for requesting capacity for the purpose of operating regular services; and also, as appropriate, for ad hoc requests for capacity.

Requests for capacity shall be made in writing. The request may, however, be sent electronically too, as provided in the Act on Electronic Service in the Administration (13/2003).

Written requests shall be addressed to RHK's Traffic System Department under the following address:

Finnish Rail Administration
Traffic System Department
P.O. Box 185
FI-00101 Helsinki

E-mailed requests for capacity shall be sent to:
kirjaamo@rhk.fi.

In accordance with the capacity request instructions, railway undertakings shall in their requests for capacity give the following information on each train:

- train diagram (so-called train graph);
- departure and arrival time;
- train type (passenger / freight train);
- maximum permitted speed;
- times / days / periods of operation.

In addition to the above-mentioned information, railway undertakings may also give the following train information:

- train number;
- priority order class;
- stops of passenger trains/ handling points of freight trains;
- other information relating to operation.

Railway undertakings may also request part of the capacity without indicating exact requirements concerning the days of operation or the train graph. Such a train could be placed in operation on the conditions to be specified in the capacity allocation decision under the direction of RHK's Traffic Control. In that case, the information on "times / days / periods of operation" need not be given in the request. RHK will request further information from the applicant if the co-ordination process so requires.

4.3.1 Schedule for Working Timetable

The timetable period in rail traffic starts yearly at the second weekend of December, at 00.00 hrs on the night between Saturday and Sunday, and ends at the corresponding time the following year. The timetable period 2007 will start on 10.12.2006 and end on 8.12.2007. Correspondingly, the timetable period 2008 will start on 9.12.2007 and end on 7.12.2008. Applicants for capacity shall request capacity not earlier than 12 and not later than 8 months ahead of the timetable period. One request may include all the changes in traffic to be made during the timetable period.

4.3.2 Schedule for requests for train paths outside the timetabling process including ad hoc requests

Decisions on the allocation of capacity for regular services may be changed for the rest of the timetable period during the timetable period concerned, provided that these changes have no effects on the capacity allocated to other railway undertakings or to international traffic within the European Economic Area. The changes may take effect at 00.00 hrs on the night between Saturday and Sunday

- at the second weekend of January;
- at the second weekend following the end of the school year.

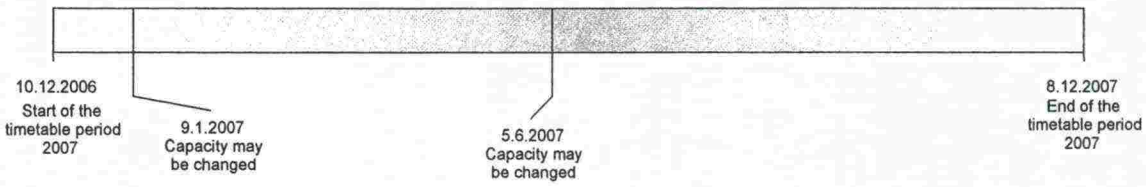

Figure 7. Dates on which the capacity for regular services may be changed during the timetable period 2007.

Requests for changing capacity allocated for regular services shall be submitted not earlier than six and not later than four months before the date on which the change shall take effect.

In addition to the above dates, RHK may for special reasons decide on other dates on which changes can take place. An applicant for capacity shall in that case apply for capacity from RHK two weeks before capacity for regular services become operative at the latest. RHK shall inform all railway undertakings of possible new dates on which the capacity for regular services may be changed.

Ad Hoc Requests for Infrastructure Capacity

Applicants for capacity may request capacity from RHK regardless of the prescribed period of time if they urgently need capacity for one or more provisional train paths. Ad hoc requests for capacity for the beginning timetable period can be made after RHK has confirmed the capacity allocation proposal.

Ad hoc requests for capacity shall be made in writing. The request may, however, be sent electronically too, as provided in the Act on Electronic Service in the Administration (13/2003). Contrary to the provisions of this Act, the decision on a request submitted electronically may be sent to the applicant for information by telefax or electronic mail as well. In such cases, the applicant is considered having been informed of the decision after the telefax message or electronic mail has been sent to the applicant.

4.4 Allocation Process

4.4.1 Coordination process

Based on the applications, RHK draws up the capacity allocation proposal (called "draft working timetable" in the Railway Act) for the next timetable period no later than four months after the deadline for the submission of requests for capacity. It has, however, been agreed in the Forum Train Europe that no more than 2.5 months shall be used for the co-ordination of requests. The capacity allocation proposal contains information on the capacity that RHK proposes to allocate to an applicant only to such an extent and with such restrictions as is necessary for implementing traffic control for the use of this capacity.

The capacity allocation proposal is primarily based on the assumption that the requested capacity will be allocated, provided that the different train paths enable railway traffic to

be operated in accordance with the technical and safety requirements. In order to improve the use of infrastructure capacity, RHK may, however, offer applicants capacity that does not essentially differ from the capacity they have requested. RHK may also decide not to allocate capacity, provided that reserve capacity is needed for the timetable period as a result of the priority order applied to rail traffic.

RHK sends the capacity allocation proposal to applicants for information within the prescribed period of time and gives them the opportunity to comment. Comments shall be presented within 30 days after receipt of the capacity allocation proposal. Customers purchasing freight transport services and associations representing purchasers of rail transport services also have the right to present comments on the capacity allocation proposal within 30 days, counted from the date on which RHK publishes an announcement in its collection of regulations that the capacity allocation proposal has been prepared.

Co-ordination Process for the Timetable Period

If there are several applicants for the same capacity or the requested capacity has effects on the capacity requested by another applicant, RHK attempts to co-ordinate the requests between the applicants. In such cases, RHK may offer the applicants capacity that does not essentially differ from the capacity they have requested.

If the co-ordination of the requests between the applicants does not lead to a satisfactory result, RHK decides on the priority order in each individual case on the grounds laid down in the Railway Act. RHK shall decide on an individual priority order no later than ten days after the co-ordination process has ended.

4.4.2 Dispute resolution process

Railway undertakings may appeal against a capacity allocation decision taken by RHK by filing a claim for rectification with the Regulatory Body. For further information, see 1.4.3.

4.4.3 Congested Infrastructure

RHK declares an element of infrastructure or a part of it to be congested infrastructure if the co-ordination of several requests for the same infrastructure has not led to a satisfactory result. RHK may also designate an element of infrastructure as congested if it is evident that it will become congested during the timetable period.

If there are several applications for the same infrastructure, the priority order is as presented in Table 1. Application of this priority order is based on the assumption that each train can be defined during its whole journey by one of the terms listed in the table. The term by which the train is defined may change during the journey of the train.

Table 1. Priority order on congested infrastructure.

Priority	Traffic
1.	Synergic passenger traffic entity[14]
2.a	Express train traffic[15]
2.b	Transport for the processing industry[16]
3.a	Local and other passenger traffic
3.b	Other regular freight traffic
4.	Freight traffic not requiring strict transport times
5.	Other traffic[17]

Derogation from the Priority Order Laid Down in the Network Statement

RHK may by a separate decision make a derogation from the general priority order laid down in the Railway Act and the Network Statement in favour of an applicant operating international traffic or such traffic as otherwise maintains or improves the functioning of the rail transport system or public transport. The same applies to cases where the rejection of the application would cause unreasonable damage to applicants, railway under-takings, international groupings of railway undertakings or to the business activities of their customers.

Confirmation of the Capacity Allocation Proposal

Based on the capacity allocation proposal and the comments presented by the parties involved, RHK shall decide on the allocation of infrastructure capacity on a fair and non-discriminatory basis. In taking the decision, RHK shall pay particular attention to the needs of passenger and freight traffic and infrastructure maintenance, as well as to efficient use of the rail network. The priority order determined for specialised and congested infrastructure shall also be taken into account, unless otherwise provided in this chapter.

Ad Hoc Requests for Infrastructure Capacity

RHK allocates the requested ad hoc capacity if there is sufficient capacity for the use specified in the request. Unless otherwise provided in the Railway Act, the ad hoc capacity is allocated on a first-come first-served basis. RHK shall take the decision on the request within five days after its submission at the latest.

---

[14] The term "synergic passenger traffic entity" refers in passenger traffic to the whole of trains which form a transport system producing clear added value for customers. A system of this kind is e.g. traffic operated according to the basic interval timetable.

[15] The term "express train traffic" refers to traffic which in some respect does not belong within the scope of the synergy-producing traffic system. International passenger traffic may belong in this category.

[16] The term "transport for the processing industry" mainly refers to transport whose immediate place of destination or origin is a port or a private siding. This transport is essentially connected with total logistics management. This group includes, in particular, combined transport, transport for the wood-processing industry and transport to ports.

[17] E.g. traffic connected with track work or museum train traffic.

4.5 Allocation of Capacity for Maintenance, Renewal and Enhancements

The rail network may also be used for transferring track machines from bases to worksites, between worksites, and for maintenance purposes. Certain tracks are mainly used for maintenance purposes. A list of these tracks can be requested from RHK's Rail Data Unit of the Rail Network Department. In accordance with the Railway Act, a safety certificate is required for traffic outside the area reserved for infrastructure maintenance if track machines are transferred as a train as well as if the traffic is connected to track work. Moreover, track machine movements shall be agreed upon separately with RHK. The track machines running on the rail network and their crews shall meet the requirements laid down under 2.8 and 2.9.

Track works which will probably be carried out during the timetable period 2007 and which are likely to have an impact on train traffic are indicated in Appendix 11.

4.6 Non-usage Rules

RHK has the right to cancel the capacity allocated to an applicant, or a part of it, if the applicant has used this capacity over a period of not less than 30 days less than required by the threshold quota specified below. In Finland, the threshold quota for the minimum use of capacity is 80 %, except on the line sections Helsinki–Kerava, Helsinki–Vantaankoski and Helsinki–Leppävaara, where the threshold quota for the minimum use is 95 %.

RHK may not, however, cancel the capacity if the failure to use it is due to non-economic reasons beyond the applicant's or the railway operator's control. RHK always cancels the capacity for such a period of time during which the railway undertaking does not have a safety certificate for operating rail services.

4.7 Exceptional Transports and Dangerous Goods

For information on the transport of dangerous goods, see point 3.4.3, Dangerous Goods. RHK's regulations concerning railway traffic and rolling stock are available on the Internet pages of the Finlex Data Bank[18] and other instructions on RHK's Internet pages.

4.8 Special Measures to Be Taken in the Event of Disturbance

4.8.1 Principles

RHK has the right to cancel the capacity totally or partially on a train path which is provisionally out of service due to a technical failure in the railway network, an accident or other incident.

In such case, RHK offers the operator alternative train paths, as far as possible. RHK is, however, not obliged to compensate for damage that may be caused to the operator, unless otherwise agreed upon with the operator in conformity with the Railway Act.

[18] http://www.finlex.fi/

4.8.2 Operational Regulation

RHK is preparing instructions on how to clear disturbances in rail traffic. RHK intends to complete the instructions by the end of 2006. RHK defines the rules for managing disturbances between railway undertakings. Railway undertakings have the right to present their own proposals for instructions how to handle disturbances connected with their own trains. The liability for harm and damages caused by disturbances shall be agreed upon by negotiation in accordance with RHK's instructions, as far as possible.

4.8.3 Foreseen problems

Disturbances are to be dealt with in accordance with RHK's instructions.

4.8.4 Unforeseen problems

Railway undertakings and RHK shall be prepared for railway accidents in their fields of activity. The principle is that railway undertakings and railway track contractors shall be prepared for clearing their own vehicles and the transported freight off the track as well as remedying the damage caused to the environment within a reasonable time after the accident. Each undertaking shall draw up an emergency preparedness plan, which RHK shall approve. The preparedness measures included in the plan shall be taken before traffic operating is started. The undertakings themselves bear the costs caused by the creation and maintenance of the emergency preparedness system. The costs caused by an accident are borne by the party having caused the accident in accordance with the Act on Liability in Track-Guided Traffic (113/1999) and the Tort Liability Act (412/1974).

RHK shall be prepared for restoring the track quickly to operable condition and within a reasonable time to the condition it had before the accident. RHK agrees thereupon when making the rail network maintenance agreements.

The Ministry of Transport and Communications decides on the emergency preparedness obligations of each undertaking, depending on the nature and extent of its activities.

5 SERVICES

5.1 Introduction

The legal framework of capacity allocation is described in the Railway Act (198/2003) and in the Government decree on the services to be supplied to railway operators.

Services concerning the usability of the rail network are described in Appendix 2 (Traffic Operating Point Register) of the Network Statement. These services may be supplied by RHK or other parties.

5.2 Services offered by RHK

RHK offers rail traffic operators on the State-owned rail network the right against payment to utilise the train paths in accordance with the capacity granted to it by RHK, marshalling yards, storage sidings, loading tracks and other tracks and passenger platforms. RHK also offers train traffic control passenger information and public address systems at the railway stations specified in the Network Statement (Appendix 12).

Use of capacity includes the right for the traffic operator to use of RHK's electricity supply network for traffic on the electrified line sections specified in the Network Statement. RHK does not, however, provide the electricity but the traffic operator shall conclude an agreement with a service provider. RHK also does not provide refuelling facilities.

RHK can offer services on a commercial basis for the use of railway operators. The additional services could comprise e.g. the use of buildings and land areas owned by RHK.

The use of services provided by RHK is agreed upon between the parties in the access contract.

5.3 Services offered by others

Railway undertakings are obliged to supply certain services and track access to services facilities for the use of railway operators if only one undertaking provides these services and it is not possible to otherwise arrange them. The availability of services shall be negotiated and an agreement shall be concluded with the service provider. The service provider has the right to charge a payment for its services. The payment shall be equitable for all railway undertakings and reasonable with respect to the costs incurred from providing the service.

Services supplied by others may include e.g. use of electrical supply equipment, refuelling, use of passenger stations, use of freight terminals, use of marshalling yards, use of train formation facilities, use of depot sidings as well as premises and equipment needed for the servicing and maintenance of rolling stock and use of maintenance and

other technical devices. These devices include sand distributors, water and electrical connections for rolling stock, radiation measurement devices, tank wagon filling gauge and brake testing equipment

6 CHARGES

6.1 Charging principles

The legal framework of the basic infrastructure charge is described in the Railway Act (198/2003), Railway Infrastructure Tax (605/2003) and the Ministry of Transport and Communications Decree on the basic infrastructure charge (208/2003).

The basic infrastructure charge covers the minimum access package (the minimum access package is described under 5.2.), including track access to service facilities on the state-owned rail network.

RHK shall collect a basic infrastructure charge from railway operators on a fair and non-discriminatory basis for the minimum access package and track access to service facilities, calculated on the basis of the actual level of use. The basic infrastructure charge shall always be based on the costs directly caused by the operation of railway traffic. The infrastructure tax consists of a charge for external costs and a supplementary charge in accordance with the Capacity and Infrastructure Charge Directive (2001/14/EC). In the charge for external costs, the environmental effects caused by the operation of rail traffic can be taken into account. The supplementary charge can be collected for covering the full amount of the costs caused by the use of the infrastructure.

6.2 Tariffs

The infrastructure charge consists of the charges mentioned in Table 2.

Table 2. Infrastructure charge.

Basic charge	Freight traffic 0.1227 cent/ gross tonne-kilometre Passenger traffic 0.1189 cent/ gross tonne-kilometre
Infrastructure tax	Freight traffic - electric 0.05 cent/ gross tonne-kilometre - diesel 0.1 cent/ gross tonne-kilometre Passenger traffic 0.01 cent/ gross tonne-kilometre
Investment tax (for line section Kerava-Lahti)	Freight traffic 0.5 cent/ gross tonne-kilometre Passenger traffic 0.5 cent/ gross tonne-kilometre

6.3 Changes to Charges

No changes to the infrastructure charge are expected.

6.4 Billing Arrangements

RHK invoices the infrastructure charge each calendar month on the basis of the realised performances of the previous month. For invoicing, railway operators shall provide the RHK contact person with information each month on the rail services operated by them to:

Lisbeth Laine
+358 9 5840 5081
lisbeth.laine@rhk.fi

6.5 Guarantees

RHK does not require any guarantee for the payment of infrastructure charges. The infrastructure charge and other charges connected with it are, however, subject to distraint without sentence or decision.

INDEX

INFRASTRUCTURE REGISTER

Legend:

On	"yes"
—	"no"
AC2	Electrification System 25 kV / 50 Hz
ATP-VR/RHK	Automatic Train Protection

Chart columns:

Traffic operating point (Node of the network) indicates all stations and junctions where it is possible to change the route of the train.

Length of line is the distance between traffic operating points.

Max gradient is the maximum gradient measured in a distance of 1200 m.

Electrification system indicates the route's catenary system

Section blocking or radio controlled section means that there is an automatic signalling system in use.

ATP means that a track section has automatic train protection in use

ERTMS means that a track section has paneuropean signalling system and GSM-R radio network.

ATP coding for tilting trains means that in this section ATP allows higher speeds for tilting trains.

Radio system states whether the type of communication equipment which is in use between the driver and traffic control is analog (line radio) or digital (GSM-R).

Traffic operating point (Node of the network)	Traffic operating point (Node of the network)	Lenght of line [km]	Max gradient, ‰	Electrification system	Section blocking or radio controlled section	ATP	ERTMS	ATP-coding for tilting trains	Radio system

RAIL TRAFFIC OPERATING POINT REGISTER

Legend:

( ) in colums regarding platforms	platform not maintained by RHK
K	yes
Y	private
K in columns regarding traffic control	remote control
M in columns regarding traffic control	manual

Chart columns:

Name means the official name of the station and is used in traffic safety work.

Another name is the name of a Traffic Operating Point in Finland's second official language. Another name is usually a Swedish name and only in Sköldvik is the Finnish name Kilpilahti used as another name despite the fact that the majority of inhabitants are Finnish speaking. This is due to traffic safety. In the line switch list the another name might also be used, often being the name of a village or district, which is more generally used by the locals than the official name.

Km Hki describes the distance of a Traffic Operating Point to the old station hall of Helsinki (torn down). The distance is measured by a track kilometre system which makes it possible to locate equipment on tracks.

Municipality is the municipality in which the Traffic Operating Point is located.

Traffic control means that the Traffic Operating Point has the technical equipment to control train traffic. It does not mean that traffic control services are provided on a regular basis.

Private sidings means that the Traffic Operating Point has at least one connection to a private siding i.e. siding owned or managed by a private owner (includes everyone other than RHK).

Shunting means that the form of the tracks of a Traffic Operating Point is such that it is possible to move at least a locomotive to the other end of a line of railcars without having to go through the main line of the Traffic Operating Point.

Min. and max platform length indicates the minimum and maximum length of platforms used by passenger trains at a Traffic Operating Point. A passenger train should not be longer than the platform of the station at which it stops. If the length of the platform is in brackets ( ), it means that the platform is not maintained by RHK and that services are operated at the responsibility of the railway undertaking.

Platform height indicates the nominal height of platforms used by passenger trains. Height is calculated from the surface of the rail.

Design train length indicates the longest track of a Traffic Operating Point, other than the main line going through it. The lenght is measured in such a way that it is usable in both directions.

Power supply indicates at which Traffic Operating Points it is possible to get 400 V or 1500 V electric current mainly for railcar or track machinery power supply purposes.

Side loading platform indicates which at which Traffic Operating Points it is possible load freight cars from the side.

End loading platform indicates which at which Traffic Operating Points it is possible load freight cars from the end of the platform (combined transports).

Loading site indicates which at which Traffic Operating Points it is possible to load freight cars at rail level. A typical example is loading of raw wood from a vehicle or an intermediate depot at a rail yard to flat cars.

Crane indicates at which Traffic Operating Points it is possible to use a crane to load wagons. The maximum capacity of the crane is also stated. RHK does not provide this service.

Fuel indicates at which Traffic Operating Points there is a fuel distribution point. RHK does not provide this service.

Passenger traffic indicates those Traffic Operating Points which have regular scheduled passenger traffic.

Freight traffic indicates those Traffic Operating Points which have regular freight traffic.

TRANSPORT OPERATION REGULATIONS FOR TORNIO-HAAPARANTA SECTION OF LINE

INTRODUCTION

This is a revised edition of the earlier publication. Some signal aspects have been discarded while others have been introduced and adopted.

The area on both sides of the border (between the HP 8/3 and T 832 signals) is classified as a "Common zone" that the traffic control operators in Sweden and Finland shall jointly reserve to be granted a train movement permission.

In principle, only one train movement is allowed at a time within the common zone, with the exception of irregular situations, such as engine failure, accident, etc.

SCOPE

The Regulations are applicable to cross-border movements and work within the common zone.

BINDING REFERENCE DOCUMENTS

BVF 900	*(Safety Regulation/ Traffic Safety Instructions)*
Jt	*(Train Safety Regulation)*

DEFINITIONS

Common zone	The area to be jointly reserved by the Swedish and Finnish traffic control operators and limited on the Swedish side by the 6/3 intermediate signal and on the Finnish side by the T 832 ground signal.
Cross-border movement	Movements that are entirely or partly operated within the common zone.
Movement	Refers to work, shunting and small-wagon shunting operations.
Permission	Refers to permissions given by the railway of the country concerned, to allow the commencement of a movement.
Swedish movement	Shunting movement or work started in Sweden.
Finnish movement	Shunting movement or work started in Finland.

GENERAL

The Regulations are drafted in Swedish and Finnish with identic content. They are applicable to Swedish and Finnish train movements that cross the border or take place within the common zone.

No movement is allowed within the common zone without the Swedish and Finnish traffic control operators having reserved the relevant section of line.

Only one movement is permitted within the common zone, with the exception of irregular situations, e.g. accident or engine failure.

NB. An agreement may nevertheless be made, to allow several movements to be operated. The agreement shall be made in time jointly by both railways.

HAAPARANTA-TORNIO-HAAPARANTA CROSS-BORDER MOVEMENTS

General

Cross-border movements are operated as specified in the Finnish Jt, as "shunting" operations, and as specified in the Swedish TRI (BVF 900), as "shunting" or "small-wagon shunting" operations.

Messages and message transmission

The Finnish staff is in contact with the Finnish traffic control operators transmitting messages to and from the Swedish traffic control operators.

The Swedish staff is in contact with the Swedish traffic control operators transmitting messages to and from the Finnish traffic control operators.

The above becomes manifest, e.g. whenever signals display a stop aspect.

Haaparanta-Tornio

Prior to the commencement of a Swedish cross-border shunting operation Haaparanta-Tornio, permission by the dispatcher in Haaparanta is required.

Prior to the commencement of a Finnish cross-border shunting operation Haaparanta-Tornio, permission by the traffic control operator in Tornio is required.

The traffic control unit having granted a permission shall be notified of the completion of the movement.

Tornio-Haaparanta

Prior to the commencement of a Finnish cross-border shunting operation Tornio-Haaparanta, permission by the traffic control operator in Tornio is required.

Prior to the commencement of a Swedish cross-border shunting operation Tornio-Haaparanta, permission by the dispatcher in Haaparanta is required.

The traffic control unit having granted a permission shall be notified of the completion of the movement.

WORK WITHIN THE COMMON ZONE

General

The Finnish staff is in contact with the Finnish traffic control operators transmitting messages to and from the Swedish traffic control operators.

The Swedish staff is in contact with the Swedish traffic control operators transmitting messages to and from the Finnish traffic control operators.

Swedish staff

The permission of the dispatcher in Haaparanta is required for work carried out by the Swedish staff within the common zone.

Prior to the granting of the permission, the dispatcher in Haaparanta shall receive a reservation of the common zone from the traffic control operators in Tornio.

The dispatcher in Haaparanta shall be notified of the completion of the movement in the common zone.

Finnish staff

The permission of the traffic control operators in Tornio is required for work carried out by the Finnish staff within the common zone.

Prior to the granting of the permission, the traffic control operators in Tornio shall receive a reservation of the common zone from the dispatcher in Haaparanta.

The traffic control operators in Tornio shall be notified of the completion of the movement in the common zone.

SAFETY CALLS AND DOCUMENTATION

Safety calls

The safety calls between the Swedish and Finnish traffic control operators shall be conducted either in Swedish or in Finnish. The translation table in Appendix 5 shall be implemented.
The safety calls shall be repeated.

Documentation, etc.

All movements that call for a reservation of the common zone shall be recorded and documented in conformity with the rules and regulations of the railway in question.

RESERVATION OF COMMON ZONE

The reservation of the common zone shall be operated jointly by the Swedish and Finnish traffic control operators.

The clearance of the occupancy of the common zone shall be operated jointly by the Swedish and Finnish traffic control operators.

MAXIMUM ADMISSIBLE SPEED

The maximum admissible speeds are specified in the speed tables (see Appendix 2).

ACCIDENT REPORTING

Any accident or risk of accident shall be reported to the Swedish or respectively Finnish traffic control operators.

MANUAL SIGNALLING

The Swedish shunting staff shall implement manual signalling as specified in BVF 900.3, irrespective of whether the activity (manual signalling) takes place on the Swedish or Finnish side of the border.

The Finnish shunting staff shall implement manual signalling as specified in Jt, irrespective of whether the activity (manual signalling) takes place on the Finnish or Swedish side of the border.

A "stop" manual signal is valid irrespective of whether it is operated in conformity with the Swedish or Finnish regulations.

SIGNALS AND SIGNAL ASPECTS

The signals and signal aspects contained in these Regulations are applicable in conformity with the regulations of the railway concerned, unless otherwise specified.

Haaparanta – Tornio direction

From Finnish track, intermediate signal (main ground signal) 1/6, km 1310.845.

"Stop"

"Proceed"

Proceed –
check clearance

Proceed –
check turnouts and clearance

From Swedish tracks, intermediate signal 5/6, km 1310.697.

"Stop"

Proceed –
check turnouts and clearance
NB. Supplement to BVF 900.3 § 3.1a), d) and 3.3c).

Swedish and Finnish tracks, intermediate signal 6/8, km 1311.006.

"Stop"

Proceed –
NB. Supplement to BVF 900.3 § 3.1a), d) and 3.3c).

Common track, Tornio T 832, km 886.8

"Stop"

"Proceed with caution"

Tornio – Haaparanta direction

No optical signals are used at Tornio for movements toward Sweden.

Intermediate signal 6/3, km 1311.012.

"Stop"

Proceed –
check turnouts and clearance
NB. Supplement to BVF 900.3 § 3.1a), d) and 3.3c).

Eng:	Dispatcher / Traffic control_____, reservation H – T, work operation.

Clearence of occupied zone

Sve:	*Tågklareraren _____, upphävande reserverad zon ____ - _____*
Fin:	Liikenteenohjaus _____, varauksen peruuttaminen välille_____ - _____
Eng:	Dispatcher / Traffic control _____, clearance of occupied zone _____ - _____

Permission to pass stop signal aspect, Haaparanta

Sve:	*Tågklareraren Haparanda, medgivande att passera signal* (ett-sex) *och/eller* (åtta-tre) *och/eller* (sex-åtta)
Fin:	Liikenteenohjaus Haaparanta, lupa ohittaa opastin (yksi-kuusi) ja/tai (kahdeksan-kolme) ja/tai (kuusi-kahdeksan)
Eng:	Dispatcher/ Traffic control Haaparanta, permission to pass signal (one-six) and/or (eight/three) and/or (six-eight).

Permission to pass stop signal aspect, Tornio

Sve:	*Tågklareraren Tornio, växling, medgivande att passera signal* (T åtta-tre-två)
Fin:	Liikenteenohjaus Haaparanta, vaihtotyö, lupa ohittaa opastin (T kahdeksan-kolme-kaksi)
Eng:	Dispatcher/ Traffic control Haaparanta, shunting work, permission to pass signal (T eight—three-two).

Zone reservation as based on danger

Sve:	*Tågklareraren _____, Fara Haparanda – Torneå.*
Fin:	Liikenteenohjaus _____, vaara Haaparanta – Tornio.
Eng:	Dispatcher / Traffic control _____, danger Haaparanta – Tornio.

Correctly read

Sve:	*Rätt uppfattat*
Fin:	Oikein ymmärretty
Eng:	Correctly read.

Repeat

Sve:	*Repetera*
Fin:	Toistaa
Eng:	Please repeat

LOADING GAUGE

The loading gauge (KU) refers to the space inside which the load on a open wagon shall remain when the wagon is in the centre position on a straight, even track.

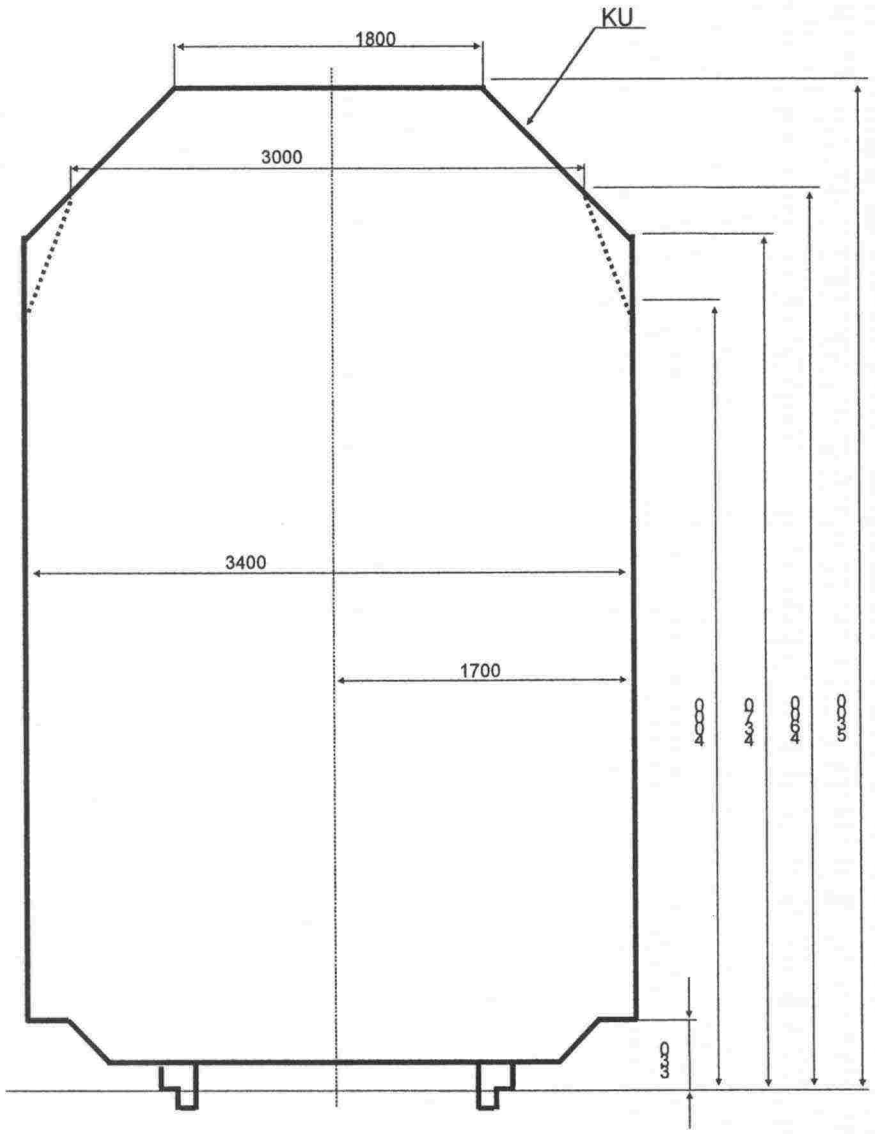

Figure 1. Principal dimensions of the loading gauge.

Use of the Loading Gauge

The loading gauge is valid on the whole rail network with the exceptions mentioned below.

The loading gauge may be used for wagons in which the wheelbase or the distance between bogie centres is max. 17.5 m and the length of the loading area of the wagon outside the wheelbase or the distance between bogie centres max. 0.2 times the length of the wheelbase or the distance between bogie centres. In other cases, loading shall be examined separately.

If there is a risk that the load may be displaced in the lateral direction outside the loading gauge during transportation, the width of the load shall be reduced correspondingly. If the displacement of the load may increase the height of some parts of the load so that they extend outside the loading gauge, the height of the load shall be reduced correspondingly.

If the load extends below the floor level of the wagon, the regulations concerning the vehicle gauge (LKU) are applied or the load is carried as a special consignment.

Loading Gauge Restrictions

The bridges on the line section Helsinki (passenger railway yard) – Pasila (passenger railway yard) – Ilmala (depot) restrict the loading gauge. The loading gauge valid on these bridges is marked with dashed line (------) on the loading gauge drawing (Figure 1).

On several industrial and other sidings, there are loading gauge restrictions, which shall be taken into account in local traffic operating.

Consignments Exceeding the Loading Gauge

Lorries, lorry trailers and containers exceeding the loading gauge may be transported on separately specified line sections on the conditions laid down in the transport permit.

Other consignments exceeding the loading gauge are transported as special consignments.

STRUCTURE GAUGE

The form and dimensions of the structure gauge (ATU) on a straight track, on open line and in the railway yard are shown in Figure 1. The space required for the mounting of the catenary structure and for the passage of the pantograph on electrified lines is marked by the broken line D-E-F-G-H-L. The widenings of the structure gauge in curves, restrictions and more detailed instructions are presented in the RAMO publication, part 2 "Radan geometria" (Track geometry).

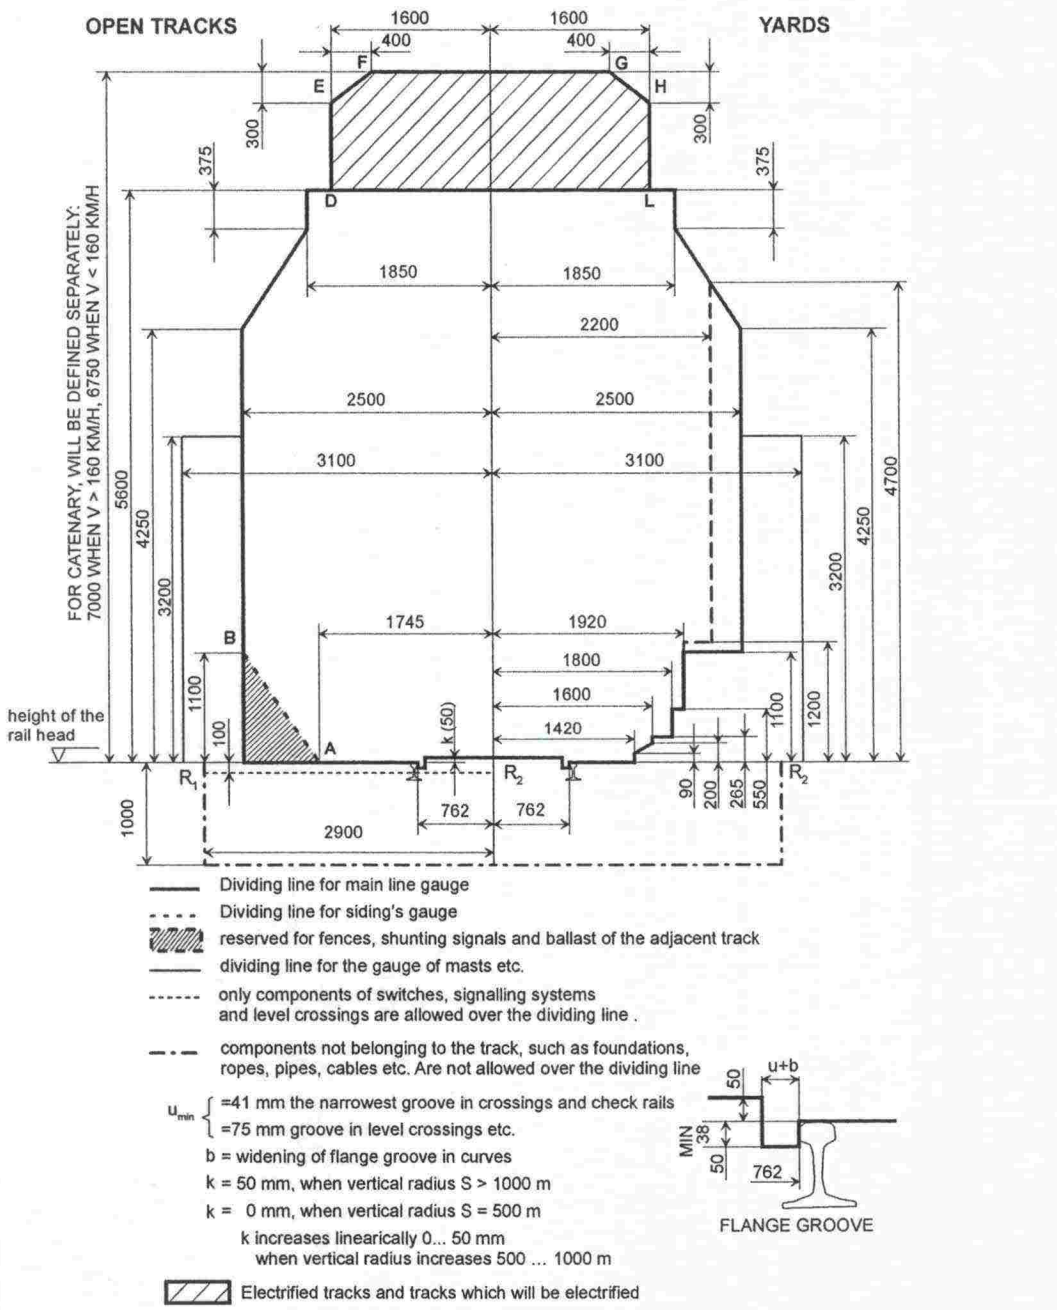

Figure 1. Principal dimensions of the structure gauge.

Effective Passing Clearance

The structure gauge described on the previous page is used as a guideline for building and mounting new structures and installations in the vicinity of the track. The structure gauge or the deviations from it constitute the so-called effective available structure gauge, i.e. the passing clearance, for special consignments. Information on the passing clearance is collected for each line section and continuously updated by the track maintainers.

LINE CATEGORIES AND PERMITTED SPEEDS FOR DIFFERENT AXLE LOADS

Other lines than those listed in table 2 are secondary lines. The secondary lines belong in different line categories in accordance with table 3.

Division of Lines into Line Categories

The lines are divided into line categories according to the superstructure as follows:

Table 1. Division of lines into line categories.

Line category		Superstructure		
		Rails	**Sleepers**	**Ballast**
RHK	**UIC**	K30, K33	wooden	gravel or equal
A	C4	K43, 54 E1, K60, 60 E1	wooden	gravel or equal
B_1	D4	K43, K60	Wooden, concrete	railway ballast
B_2	D4	54 E1	Wooden, concrete before 1987	railway ballast
C_1	D4 /E4	54 E1	Concrete 1987 and after	railway ballast
C_2	D4/E4	60 E1	concrete	railway ballast

The limit of the line category is marked in the middle of the station building at the traffic operating point or indicated by kilometre marking at some other point.

The line categories in which the different line sections belong are also presented in Figure 1.

Responsibility of Track Maintainers

Track maintainers have the right to issue, at their discretion, regulations restricting the permitted axle load and speed depending on the condition of the track superstructure.

APPENDIX 6 Line Categories and Permitted Speeds for Different Axle Loads

Table 2. Categories of the main lines and permitted speeds for different axle loads.

1) Restriction caused by bridges

Secondary Lines and Sidings

The maximum permitted speed on secondary lines and sidings is 35 km/h, unless otherwise prescribed separately.

On the sidings belonging in line category A, the maximum permitted speed is 20 km/h.

On the following secondary lines, the speeds defined in Table 3 are permitted for different axle loads:

Table 3. Permitted speeds on sidings for the different axle loads.

Wagons with Axle Loads Above the Accepted Limit

1) A wagon whose axle load exceeds the maximum axle load permitted for a specific line category is too heavy for the line category in question.

2) Wagons shall not be intentionally overloaded. When an overload is discovered, the speed of the train shall be reduced in accordance with Tables 3 and 4 and Point (3). If the weight of the load exceeds the permitted load by more than 5% (by more than 2% for 25 t axle load), the excess load shall be unloaded at the first possible station.

3) If the maximum permitted axle load of the wagon is 22.5 t, overloaded wagons may be transported only with the following maximum speeds:

APPENDIX 6 Line Categories and Permitted Speeds for Different Axle Loads

Line category	Max. axle load [t]	Speed [km/h]
A	—	—
B_1	23,5	35
B_2	23,5	50
C_1, C_2, D	23,5	80

Moreover, transportation shall be carried out in accordance with the regulations for special consignments. The condition of the wagons shall be inspected before transportation, especially as concerns the wheelsets.

4) On certain lines belonging in line category A, overloaded wagons may be transported in regular traffic. The axle loads mentioned below shall not be exceeded, and the excess load shall be unloaded at the station where it is discovered. The maximum permitted speed is 40 km/h on the track and 20 km/h on K30 switches. The line sections and the axle loads permitted on them are as follows:

Line section	Max. permitted axle load [t]
Parkano – Niinisalo	20
Parkano – Kihniö	20
Isokylä – Kelloselkä	20
Äänekoski – Haapajärvi	20
Murtomäki – Otanmäki	20
Kontiomäki – Ämmänsaari	20
Savonlinna – Huutokoski	20
Joensuu – Ilomantsi	20
Porokylä – Vuokatti	20

5) On the *secondary lines* belonging in line category A, overloaded wagons may be transported as follows:
   - axle load not more than 20 t, speed 35 km/h
   - axle load over 20 but not more than 22.5 t, speed 20 km/h

   Traffic with over 22.5 t axle loads on the secondary lines belonging in line category A is forbidden.

6) On the *sidings* belonging in line category A, overloaded wagons may be transported as follows:
   - axle load not more than 2.5 t, speed 20 km/h

   Traffic with over 22.5 t axle loads on the sidings belonging in line category A is forbidden.

7) On the *main lines* belonging in line category A, overloaded wagons may *temporarily* be transported as follows:
   - axle load not more than 22.5 t, speed 20 km/h

   Temporary transportation of overloaded wagons is allowed if occasional need arises. The maintainer of the line shall be informed of temporary transportation of overloaded wagons to control the condition of the line superstructure.

8) Wagons with 24,5 t axle load built according to the Russian standard may be carried as special transport on the line sections laid down separately on the conditions specified in the transport permit. Traffic on the secondary lines and sidings belonging in the line category A is forbidden.

9) Bridge restrictions, see appendix 10 of the Network Statement.

10) Wagons with axle loads above the accepted limit, other than those mentioned under (3), (4) and (5), which do not have a permit for permanent traffic, are handled as special transport.

1) Indicated with a speed board

APPENDIX 6 Line Categories and Permitted Speeds for Different Axle Loads

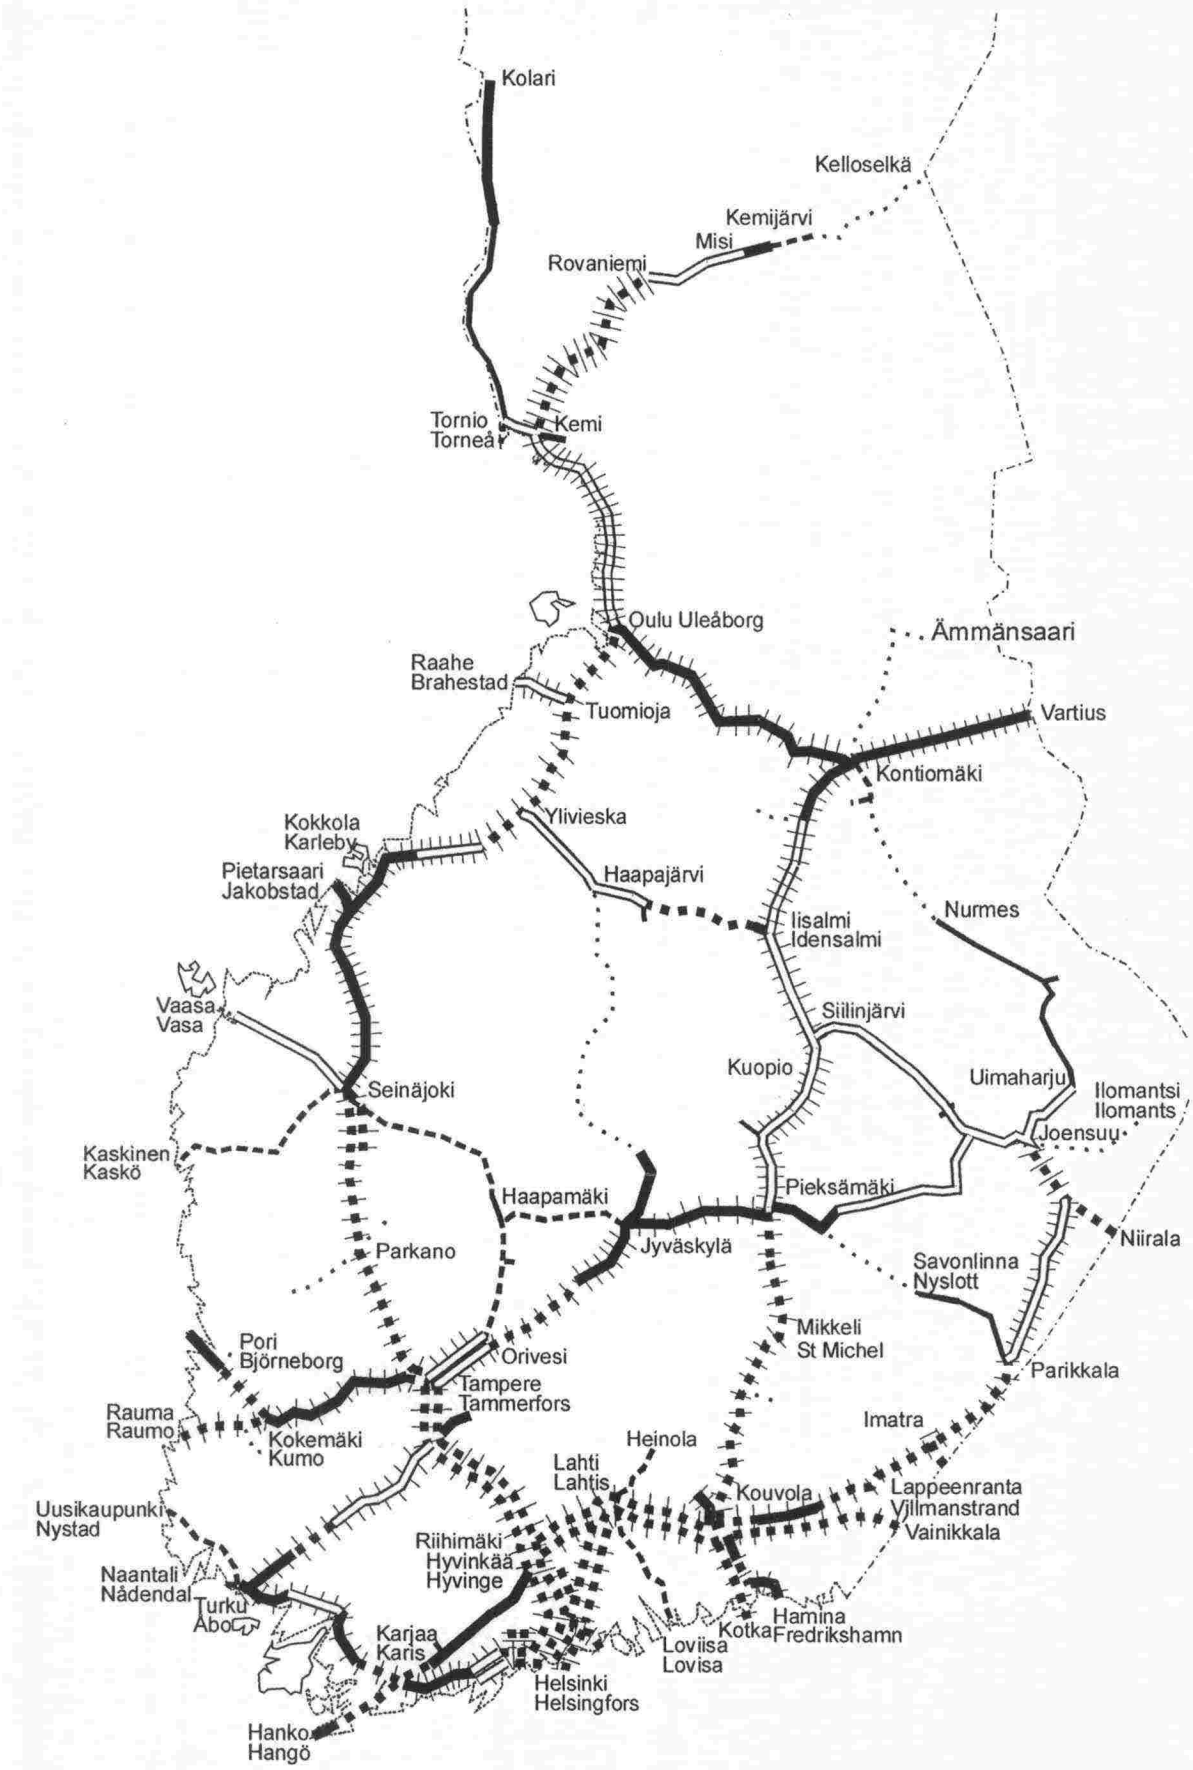

Figure 1. Line categories and electrification (markings' explanations on the next page).

APPENDIX 6 Line Categories and Permitted Speeds for Different Axle Loads

Line category	Superstructure				
	Non-electrified	Electrified	Rails	Sleepers	Ballast
A			K30, K33	Wooden	Gravel or equal
B_1			K43, 54 E 1, K60, 60 E1	Wooden	Gravel or equal
B_2			K43, K60	Wooden, concrete	Railway ballast
C_1			54 E1	Wooden, concrete before 1987	Railway ballast
C_2			54 E1	Concrete 1987 and after	Railway ballast
D			60 E1	Concrete	Railway ballast

The border of line category is in the middle of traffic operating point's station, unless there is not declared some other location by kilometremarking.

SIGNALLING SYSTEMS

The signalling systems used on the lines are represented in the figures in this appendix. The lines on which none of the signalling systems mentioned in the figures is used, are controlled manually by the dispatchers.

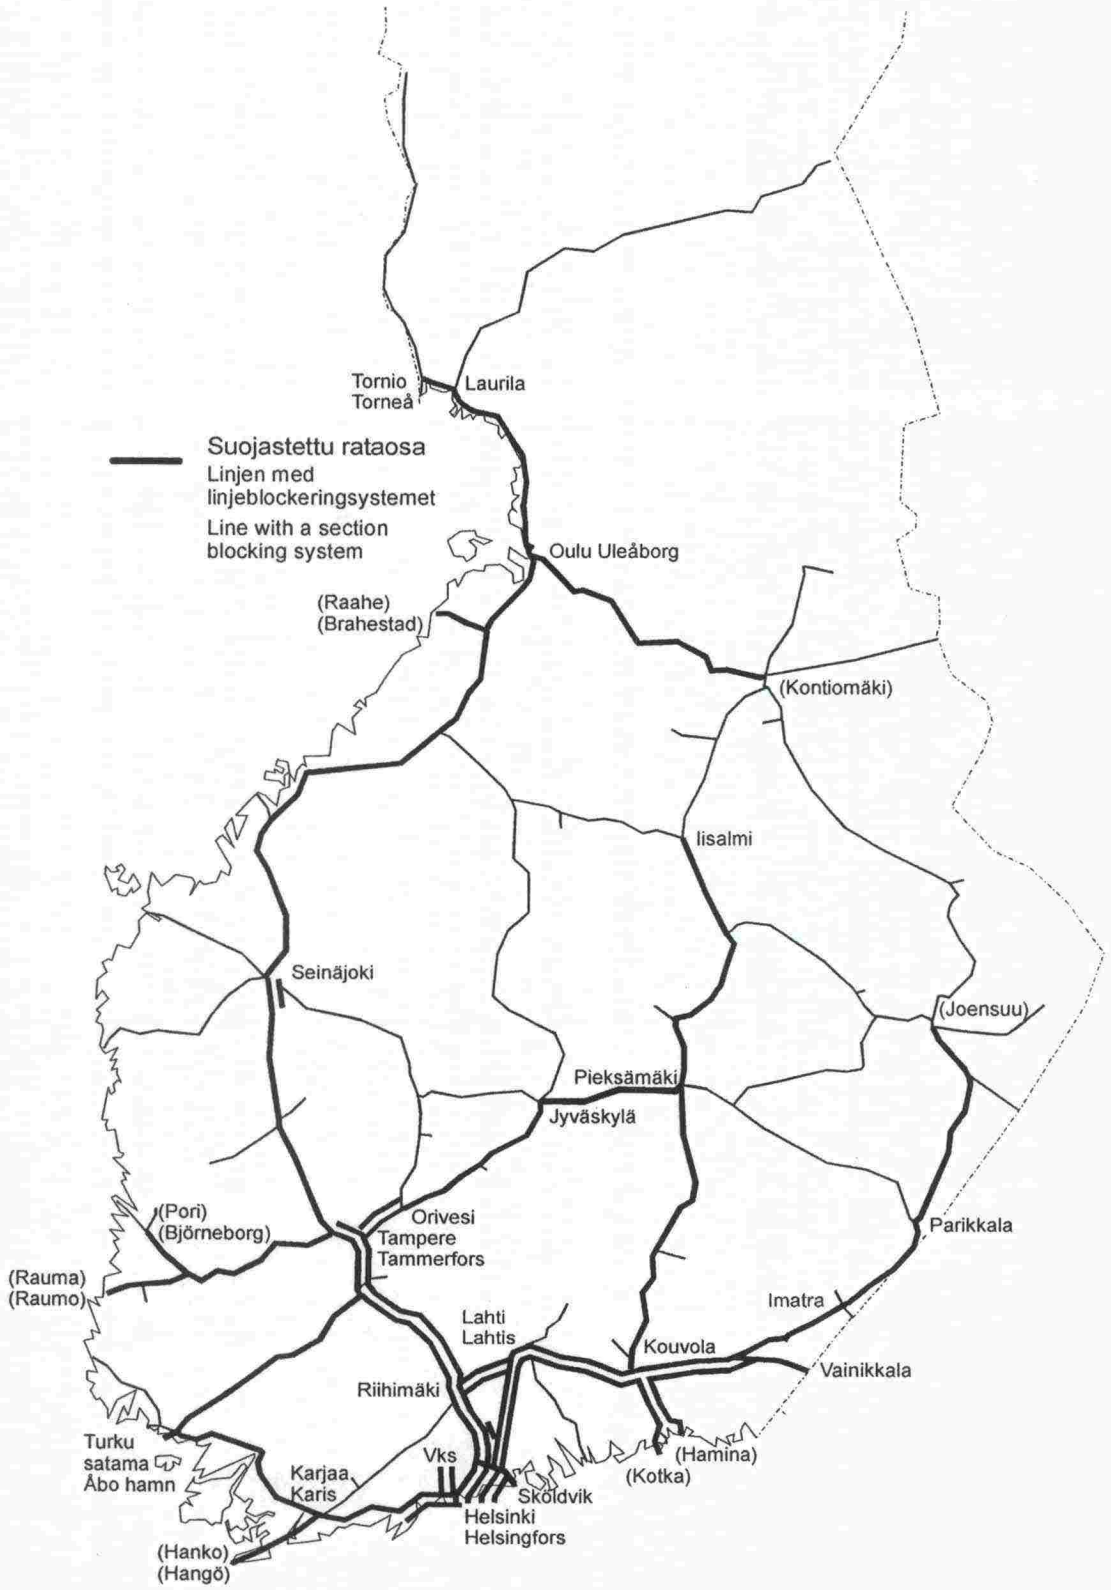

Figure 1. Lines with a section blocking system.

BRIDGE RESTRICTIONS

On the bridges mentioned below, axle loads, speed or both impose restrictions on the running of rail vehicles. The speed restrictions are indicated by speed boards.

Bridges with Axle Load Restrictions

1) Kyrönsalmi bridge on the Parikkala-Savonlinna line section
   - Axle load restriction 22.5 t
   - Maximum permitted speed on the bridge is 20 km/h

2) Seinäjoki, Kyrönjoki, Nenätönjoki, Kainastonjoki, Teuvanjoki, Närpiönjoki and Kaskistensalmi bridges on the Seinäjoki-Kaskinen line section.
   - Axle load restriction 22.5 t
   - Maximum speed on the bridges is 60 km/h, unless a lower speed is prescribed separately.

These regulations do not apply to 6- or 8-axle wagons built according to the Russian standard, which can be carried over the above-mentioned bridges only as special trans-port on the conditions laid down in the transport permit.

Movable Bridges

On movable bridges, the maximum permitted speed is 40 km/h, unless reduced for other reasons. If the movable bridge is locked and the rail joints are equipped with fishplates or other corresponding locking or control, the maximum speed is 60 km/h, if not reduced for other reasons.

Table 1. Restrictions caused by movable bridges.

Bridge	Line section	Permitted speed [km/h]
Pohja	Tammisaari–Hanko	50
Kyrönsalmi	Savonlinna–Parikkala	20[1]
Pirttiniemi	Varkaus–Viinijärvi	40[2]
Taipale Canal	Varkaus–Viinijärvi	40[2]
Pielisjoki	Joensuu–Lieksa/Viinijärvi	50
Päiväranta	Kuopio–Iisalmi	60
Uimasalmi	Joensuu–Lieksa	60
Tahkoluoto	Pori–Tahkoluoto	50

[1] See Bridges with Axel Load Restrictions.

[2] The bridge and the rail joints can be locked, in which case the permitted speed is 60 km/h.

Bridges Restricting the Structure Gauge

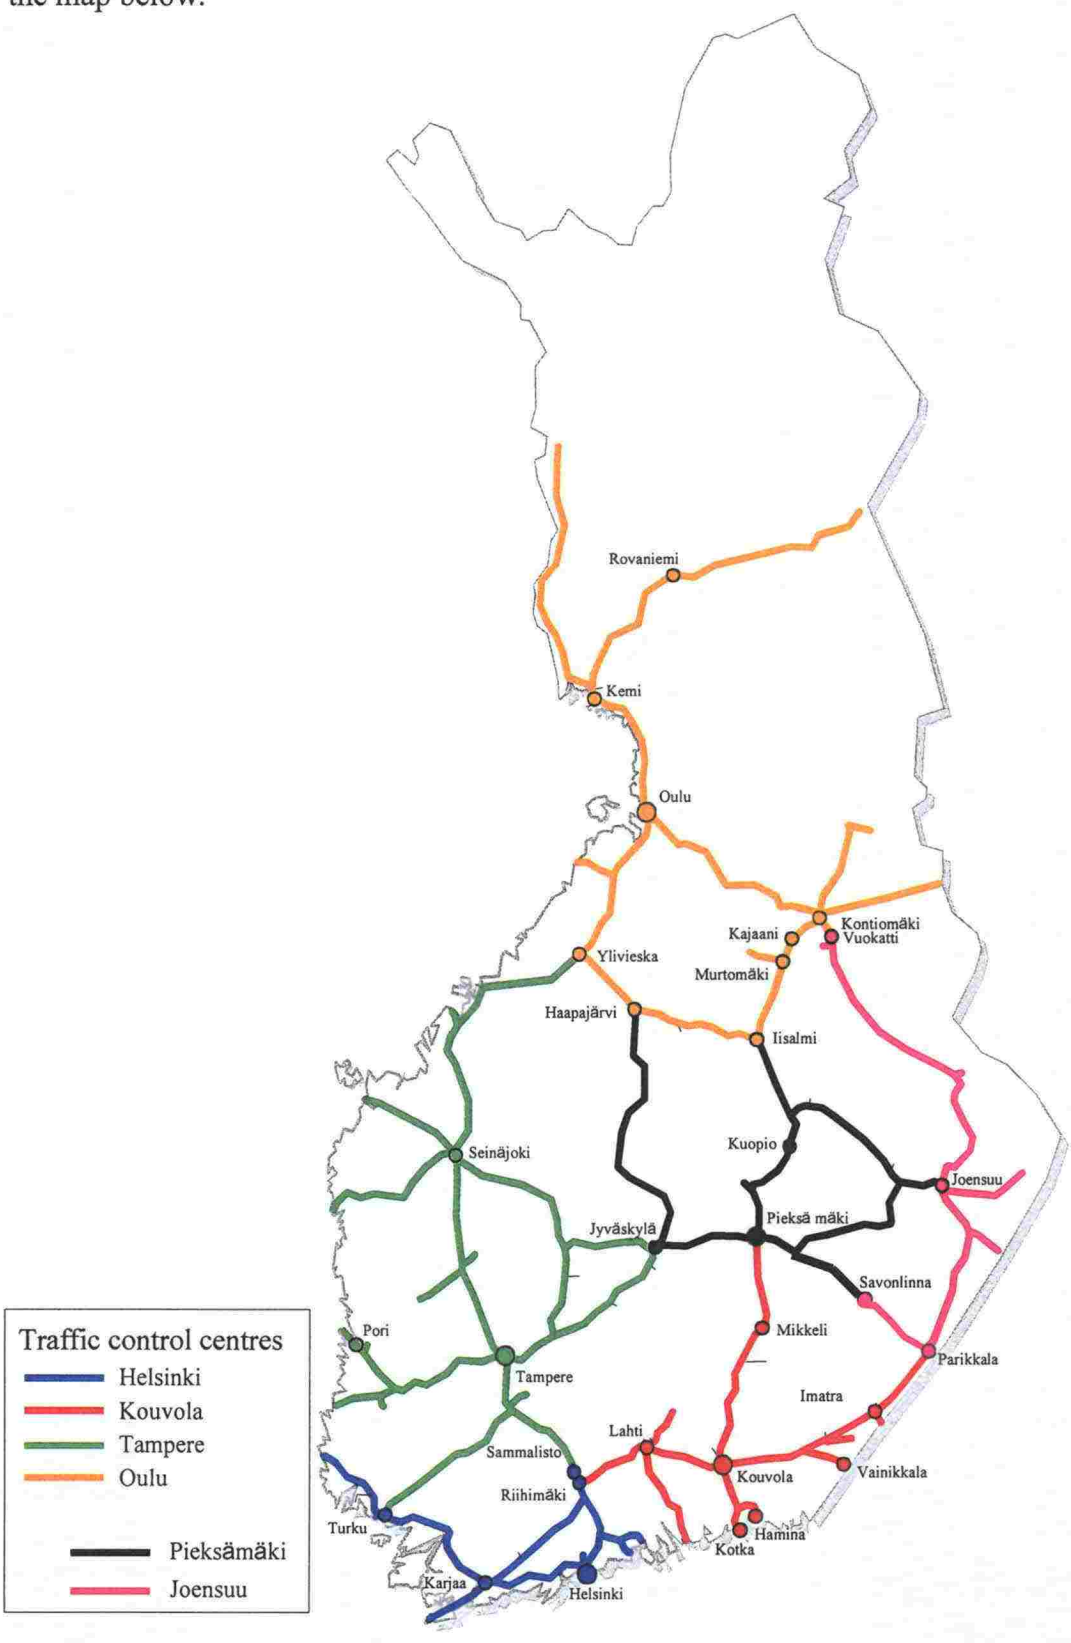
The bridges which restrict the loading gauge (KU) presented in Appendix 3 are located on the line section – Helsinki (passenger railway yard) – Pasila (passenger railway yard) – Ilmala (depot). The loading gauge permitted on these bridges is indicated by dashed line (------) on the loading gauge drawing (Appendix 3).

TRACK WORKS AFFECTING TRAFFIC IN 2007

SOUTH FINLAND	AFFECTS TRAFFIC
• Espoo-Kirkkonummi-Turku: screening of ballast; tunnels and foundation structure	•
• Kerava-Savio: 5th track	•
• Leppävaara-Kirkkonummi: track work at the station	
• Hakamäentie bridges	•
• Helsinki and Riihimäki remote control	
• South Finland remote control (ESKO)	
• Renovation of Ilmala railway yard	
• Modification work in central Pasila	
• Hyvinkää-Hanko: work regarding level separated crossings (Otalampi)	•
• Karjaa-Hanko: Bridge of Karjaa bypass road	•
• Turku-Toijala: ballast renewal (incl. Kiimasuo)	•
EAST FINLAND	
• Lahti-Vainikkala	•
• Luumäki-Joensuu: railway yard work Par-Jns, ballast work on weak soil area at Tikkala	•
• Joensuu-Viinijärvi: Underpass at Pankakoski	
• Pieksämäki-Kuopio: reinforcement of rock and tunnel	
• Kouvola-Kuusankoski: ballast renewal	•
• Kuopio-Iisalmi: rail replacement, mainline points and foundation structure	•
• Reorganisations at Kuopio railway yard (incl. signal boxes)	
• Imatra-t II phase	•
• Kotolahti railway yard	
• Kouvola-Kotka: block system+remote control+Juurikorpi+Kymi+Myllyk., Ikr sleepers	
• Kouvola-Kotka/Hamina: removing level crossings (Kierikka underpass)	
• Siilinjärvi ja Iisalmi: signal boxes and remote control	
• North Savo: raising the speed limit on some parts of the track, bridges and embankment work	•
WEST FINLAND	
• Seinäjoki-Oulu: raising the standard, I phase	•
• Seinäjoki-Oulu: ballast renewal	•
• Tampere-Seinäjoki: 25 t, 200 km/h	•
• Tampere: tunnel at station, platform and track modifications	•
• Tampere: renewal of points automatics of marshalling yard	•
• Jämsänkoski-Jyväskylä: reinforcement of rock cuttings and tunnels	•
• Haviseva-Orivesi: screening of ballast of western track and straightening of track at Oriselkä	•
• Rauma: signal boxes and remote control, Pori-Mäntyluoto: signal boxes and remote control and Tpe: remote control	
NORTH FINLAND	
• Seinäjoki-Oulu: raising the standard, I phase	•
• Seinäjoki-Oulu: ballast renewal	•
• Tornio-Kolari: ballast renewal	
• Misi-Isokylä: ballast renewal	
• Kontiomäki-Vartius: replacement of sleepers	•
• Rovaniemi: signal boxes and remote control	
• Oulu-Laurila: Kuivaniemi underpass	
• Oulu-Kontiomäki: Madekoski underpass	

Map of traffic plannig areas

Coordination of track work and traffic is done according to traffic planning areas shown in the map below.



PASSENGER INFORMATION AT THE STATIONS ON THE STATE-OWNED RAIL NETWORK

Table 1. Passenger information at the stations.

Line section	Information system
Helsinki–Turku, Helsinki–Hyvinkää	The so-called HELMI system at the liveliest stations. This is an automatic electronic information system, giving timetable-based passenger information and information on train delays. Some of the stations are only provided with remote announcement equipment.
Helsinki-Vantaankoski	Remote announcement equipment between Pohjois-Haaga and Vantaankoski
Riihimäki–Tampere	Stations are equipped with an electronic information system, giving timetable-based passenger information and warning of passing trains. Riihimäki, Hämeenlinna, Toijala and Tampere have electronic timetable-based information equipment and automatic announcement equipment.
Toijala–Turku, Tampere–Pori, Oulu–Kontiomäki, Kouvola–Pieksämäki	Remote announcement equipment
Other major stations	Automatic announcement equipment
Other stations	Generally provided with remote announcement equipment.
Travel centres Seinäjoki, Jyväskylä, Kouvola, Lappeenranta, Pieksämäki, Oulu, Rovaniemi	Electronic timetable-based information equipment, automatic announcement equipment. New travel centres will be equipped with this system.

NETWORK STATEMENTS OF OTHER COUNTRIES

The table below shows the Internet addresses of the Network Statements published by the Infrastructure Managers of other countries, and the names used for the Network Statement. The information given in the table may change.
